Mr. C. A. Lee, of the engineering staff of the British Columbia Electric Railway Company, left on April 20 for Washington, D.C., to join the United States navy civil engineering corps, with the rank of lieutenant. Mr. Lee was in charge of the work at Coquitlam dam in 1911 and the hydro-electrical installation at Jordan River, near Victoria, from 1912 to 1915.

Mr. W. S. Ford, lieutenant Royal Garrison Artillery, 122nd Siege Battery, B.E.F., who in the past has been assistant hydraulic engineer with the Canadian Boving Company, designing water-power plants, Diessel engine plants, etc., and also with the Western Canada Power Company, Stave Falls, B.C., on power-house construction, waterways, surveys, etc., has been elected an associate member of the Canadian Society of Civil Engineers.

Mr. Frederick John Bell, of Toronto, president and general manager of the Canada Wire & Cable Company, has been elected a member of the Canadian Society of Civil Engineers. Mr. Bell is also vice-president of the St. Catharines Steel and Metal Company; manager for Mr. E. A. Wallberg, C.E., Montreal, and acts in an advisory capacity for the Laurentian Power Company,. For several years he was on the staff of the Canadian General Electric Company.

Mr. John Murphy, electrical engineer, Department of Railways and Canals, has been appointed the duly authorized agent of the Fuel Controller for Canada to promote the substitution of hydro-electric power for steam power, having in mind the conservation of coal. Mr. Murphy has served a long apprenticeship in the telephone, and the electric light, power and railway field, which experience is proving of great value to the various federal controllers, commissions and departments with which he is now associated.

Captain Paul F. Sise, general manager and vice-president of the Northern Electric Company, Ltd., who was for some time in the United States with the staff of the British Recruiting Commission, has returned to Montreal, for the purpose of special work in connection with the recruiting of Jewish young men for the Jewish battalions now being raised in Canada and the United States for service with the British expeditionary force in Palestine. The work will include Jewish recruiting all over the Dominion, and Captain Sise will visit other Canadian cities. The battalions will be mobilized at Windsor, N.S.

Mr. W. R. Bonnycastle, of Vancouver, has been elected a member of the Canadian Society of Civil Engineers. Mr. Bonnycastle is a consulting hydro-electrical engineer, specializing on water-power development, and is also engineer for the Bridge River Power Company and the Indian Power Company, B.C. As well as being connected with Mr. R. S. Kelsch, of Montreal, on the design of the Kaministiquia power development, Fort William, he was electrical engineer with the Stave Lake Power Company, designing engineer with the Western Canada Power Company, and engineer for Smith, Kerry & Chace.

W. H. Banfield & Sons will move their fixture department from Adelaide Street to a new sales and showroom at 80 King Street West, about June 1st. They will install a complete range of fixtures, glassware, piano and table lamps, silk shades and all classes of fixture accessories. This location is in the center of the electrical district in Toronto and will be very convenient for out of town customers.

The Siemens Company of Canada, Ltd., Montreal, has obtained an order from the Department of Public Works, Ottawa, for 17 knots of submarine cable for delivery at Halifax and Vancouver. The cable will be manufactured at the company's works, Woolwich London, Eng.

The Montreal office of the Jefferson Glass Company, Limited, has been moved from the Royal Trust Building to the 10th floor of the Guarantee Building, 285 Beaver Hall Hill.

The electricians in the employ of the city of Vancouver have been given an increase of $20 per month, which will make their monthly wage $145 and $125 flat, instead of the union scale they formerly advocated of $6.30 for a day of eight hours, with double pay for overtime.

The Canadian Tungsten Lamp Company, Limited, of Hamilton, have issued a booklet entitled "Blue Label Lamp Data Book." It is well illustrated and contains a quantity of useful information.

The Prince Rupert Hydro-Electric Company has offered the city of Prince Rupert their plant at Falls River, including all improvements, for $34,000 in municipal bonds, and the offer is being given consideration.

The Canadian Refrigerating Plant, of Victoria, plans changes in their equipment, amounting to $25,000. The capacity of the plan is to be increased by the installation of machinery equipped for electrical operation.

For the Amateur Gardener

Garden Steps—by Ernest Cobb; Silver, Burdett & Company, Boston, publishers; a manual for the amateur in vegetable gardening. These are days when practically every householder, whatever his down-town business may be, is interested in the utilization of some small plot of ground for increasing food production. Experience has shown, however, that there is a very considerable percentage of wasted energy, due to lack of experience or knowledge of the rudiments of vegetable gardening. In this connection we are pleased to have located an up-to-date little book which covers briefly and practically most of the operations with which amateur gardeners are concerned. As the author states in the preface, he has endeavored to gather into small space "the necessary information regarding the culture of each important vegetable for the home garden and arrange it so that the amateur may take each necessary step in its proper turn, guided by clear, explicit directions." The book comprises 225 pages, nicely illustrated, of the most readable, helpful, and practical information the writer has seen.

Current News and Notes

Collingwood, Ont.

The Water and Light Commission of Collingwood, Ont., have contracted to supply a further block of 800 h.p. to the Collingwood Shipbuilding Company. Additional transformer and sub-station capacity will be required.

Halifax, N.S.

As a result of a plebiscite on the Halifax Power Company question the city has been authorized to advance the company $400,000, receiving in return a mortgage for $400,000 and 51 per cent. of the stock of the company. The company receives a 25-year contract for street lighting at $30,000 a year.

Morrisburg, Ont.

The New York and Ontario Power Company have made application to the International Joint Commission for approval of plans to reconstruct their dam and plant at Waddington, on the St. Lawrence. The company propose to construct a new dam and power-house.

Niagara Falls, Ont.

The Niagara District Independent Telephone Company, which has been serving the peninsula farmers for years, has sold out to the Bell Telephone Company.

Quebec, Que.

The Levis County Railway have made fare increases amounting to practically 100 per cent.

Regina, Sask.

The City Council of Regina, Sask., are considering a 20 per cent. increase in light and power rates. The cost of operating the power plant is said to have been $55,000 more last year than was anticipated.

Sault Ste. Marie, Ont.

Fire, on the morning of May 2, destroyed the old power station of the Great Lakes Power Company, Sault Ste. Marie, Ont. The new plant, however, was not affected. Temporary installation was made to take care of the street railway and a portion of the d.c. power formerly supplied by the old plant. As yet it has not been decided what action will be taken, but it is very probable that, rather than reconstruct the old plant, an extension will be made to the new plant. The latter was designed so that it could be readily extended.

Toronto, Ont.

Notice has been given to customers of the Toronto Electric Light Company of a minimum charge of 50 cents a month on all domestic connections. The company will benefit chiefly during the summer months when houses are closed.

The Toronto Street Railway Company have now definitely decided to employ women conductors. They will receive the same pay as the men, although it is possible they may work on shorter shifts.

The gross receipts of the Toronto Street Railway Company for the month of April were $543,054.77, and the city's percentage $108,610.95, as compared with gross receipts of $510,334 for the corresponding month last year, with the city's percentage at $102,066.98, or an increase in the interests of the [illegible] $6,543.97.

Vancouver, B.C.

The West Kootenay Power Company has begun preliminary work on the high-power line from Rossland to the Canada Copper Corporation, at Copper Mountain, near Princeton. The extension will be about 180 miles long, and is expected to cost, including laterals and sub-stations, between $2,000,000 and $2,500,000.

The Kootenay General Hospital, Nelson, will soon be equipped with an electric lighting system if the plans under consideration are carried out. The cost of the work is expected to be about $1,180.

The electrical equipment, including lighting and power, in the assembling plant of the Imperial Munitions Board at Victoria, was installed by C. H. E. Williams, contracting electrical engineer, Securities Building, Seattle.

Winnipeg, Man.

Jitneys have now been permanently banished in the city of Winnipeg.

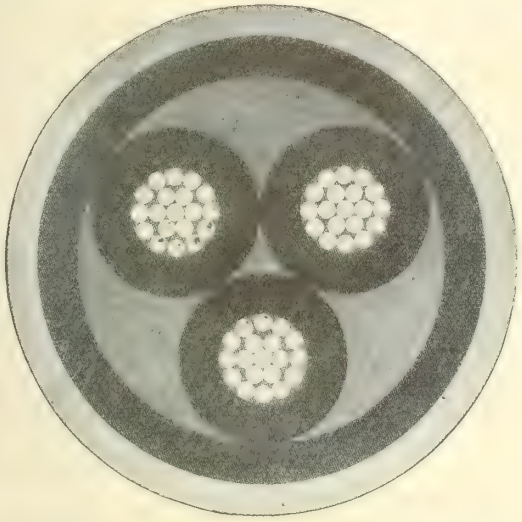
The Winnipeg Street Railway Company, it is said, will immediately pay the city $105,000 due on 1917 percentages, grant salary increases to the amount of $82,000 a year, and install a system for the protection of the city service mains from electrolysis.

Trade Publications

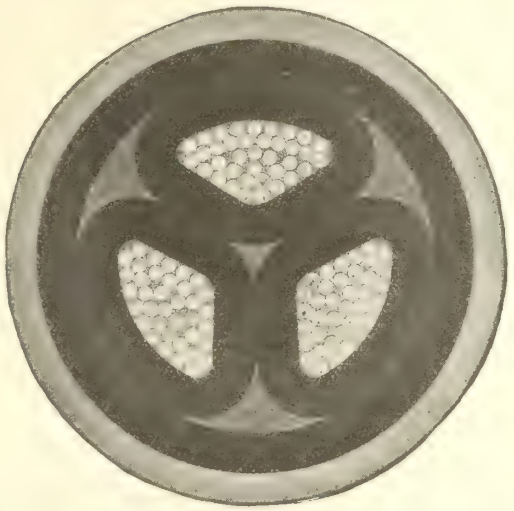
Mellowlight—Bulletin R, issued by the Canadian General Electric Company, describing "Mellowlight" semi-indirect lighting fixtures; illustrated.

Condulets—Condulet Suggestion No. 27, by the Crouse-Hinds Company of Canada, showing an actual installation of Type FHF condulet, which makes an ideal fitting for control of household heating devices; manufactured strictly in accordance with the Code.

C. G. E. Publications—Bulletin No. 44678, describing drum type controllers for railway service. Also leaflets describing tank lifters for G-E type F, forms K5 and K13, oil switches; G-E oil switches for pole line service, Type F, Form P7, and Thomson direct current astatic watthour meters for switchboard service.



M.S.L. Batteries—The Canadian Hart Accumulator Company are distributing a handy pocket-size catalog giving complete data regarding the care, maintenance, and repair of storage batteries in general and also comprising complete replacement data showing the various types and sizes of batteries used on all makes of automobiles and the M.S.L. battery suitable for each model.



Rheostats—Circular No. 501, by the Ward Leonard Electric Company, describing their "Universal" battery-charging rheostats for garage service. The booklet describes a very useful and efficient series of present-day equipment. The Ward Leonard Electric Company have also issued Bulletin No. 50, which describes in detail the method of determining the proper size of a battery-charging rheostat.

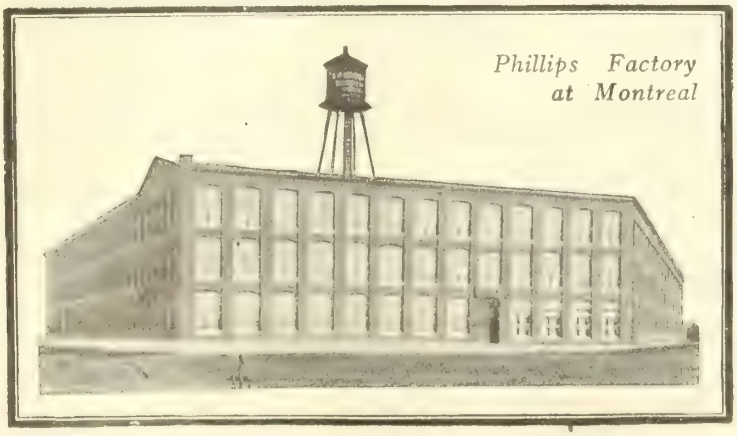
"Electrical Equipment for Cement Mills"—Circular No. 7174, just issued by the Westinghouse Electric and Manufacturing Company. The pamphlet has an attractive art cover, illustrating the interior of a motor-driven cement mill, while numerous photographic reproductions are given throughout the publication, showing the application of motors to various types of machinery employed in cement mills. Advantages of motor drive for this class of service and characteristics required by motors to be specially successful are given briefly.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

FOR SALE

[illegible] tungsten or nitrogen, 5-light cluster fixtures, 20" [illegible] porcelain enameled steel reflector. Malleable iron cross arms, pony glass insulators. High tension mica insulating joint, tested to 30,000 volts. In service for short time. 200 Majestic Balls, 12 in. x 12 in. x 6 in. fitter. Entirely new.

Full description regarding the above apply to Galt Hydro-Electric Commission, 50 Dickson St., Galt, Ont. 10-11

POSITIONS VACANT

WANTED—Draftsmen with experience on transformers, induction motors, or direct current machines. Apply stating experience and salary expected, to Box 731, Electrical News, Toronto. 9-11

WANTED—Several experienced draftsmen, more particularly those having experience in switchboards, also draftsmen having experience in generators and transformers. In applying state previous experience, where at present employed, salary expected. Apply Works Engineer, Canadian General Electric Co., Peterboro. 10-11

Increased Use of Electric Vehicles in England and Ireland

The high price of gasoline (it is now costing more than $1 per imperial gallon) and the multiplying of electrical supply stations are said to be creating a new demand for electric vehicles for both pleasure and commercial purposes in the United Kingdom. It is not supposed that such demand can be met by British manufacturers, as long as their energies are being devoted to supplying government needs, but after the close of the war there will in all probability be a marked development along this line, since to maintain and operate certain electric vehicles will be more economical, and there will undoubtedly be standardization of construction. It is thought that through standardization it will be possible to construct a two-seated runabout complete for less than $500, and a half-ton tradesman's van for about $750.

The raailroad companies are using them extensively, and in other lines of business, as well as for municipal use, the demand for them cannot be met. In some cities electric power has been adopted for omnibus service At pre-war rates for gasoline the relative over-all costs of running petrol and electric omnibuses worked out practically 17 and 15 cents per car-mile. The cost of gasoline has advanced 250 per cent., whereas the advance in cost of electrical energy has been only about 10 per cent. In many places in England power for commercial electrics can be obtained for 2 cents per unit. An electric passenger car travels nearly, if not quite, a hundred miles on a single battery charge.

A report by Electrical Engineer T. W. Bloxam to the Tramways and Electricity Committee upon electric compared with petrol vehicles was presented to the City Council of Belfast recently.

The report states that in May, 1915, the department commenced using an electric wagon with a nickel-iron battery in place of a petrol-driven wagon, for the ordinary repair work of the overhead equipment, and a material saving in cost had resulted, as the greater facility for starting, stopping, and manoeuvring in traffic more than counterbalanced any loss of time on the road, unless the journey was to a distant part of the city. During the 2¼ years ended July, 1917, the electric wagon ran 7,398 miles, and used 6,651 units of electricity (0.89 units per mile), the cost per unit for the past year being 1.137d. per unit. The petrol vehicle ran 5,800 miles, and used 1,621 gallons of petrol (0.28 gallon per mile), the cost per gallon being 2s. 3¾d. Therefore, during the year to March, 1917, the "electric" cost 1.01d. per mile for electricity, and the "petrol" cost 7.77d. per mile for petrol, a difference of 6½d. per mile, or £70 per annum.—N. E. L. A. Bulletin.

ALTERNATING CURRENT

2—100 K.W., General Electric, 3 phase, 60 cycle, 2300 volt generator, type GTB, form D, complete with switchboards.

1—200 KW., 3 phase, 60 cycle, 1100 volt, General Electric generator, type GTB, form D, speed 600.

1—450 K.V.A., 2300 volt, Allis-Chalmers, 200 speed, 3 phase, 60 cycle generator, 2 years old, good for direct connection for engine drive or water wheel drive.

1—100 H.P. new Westinghouse motor, 3 phase, 60 cycle, 550 volt, 900 speed.

1—100 H.P., new General Electric, 3 phase, 60 cycle, 440 volt, 720 speed, slip ring, complete for heavy starting duty.

1—50 H.P. new General Electric, 440 volt, 1200 speed, 3 phase, 60 cycle, slip ring motor.

1—50 H.P. General Electric, 220 volt, 900 speed, type I, form L.

2—50 H.P. new Allis-Chalmers, 550 volt, 3 phase, 60 cycle, 900 speed motors.

MOTOR GENERATOR SET

1—40 KW., 125 volt, General Electric, 720 speed, type CL, form B, 6 pole generator, connected on one sub base to a 60 H.P., 3 phase, 60 cycle, 2080 volt, 720 speed, type M, form C, Fort Wayne motor in A1 condition and complete. Three bearing machine.

DIRECT CURRENT

2—100 H.P., 110 volt, Holtzer-Cabot D.C. motors, 550 r.p.m., full commutators.

1—10 KW., 125 volt, Bullock, 400 speed, marine set, direct connected on one sub base to a Westinghouse vertical engine.

1—50 KW., 125 volt, General Electric, 280 speed, type MP generator, direct connected to an 11 x 12 vertical marine type engine.

1—300 KW., 500 volt, D.C. General Electric generator, 400 r.p.m.

1—56½ KW., 125 volt Westinghouse, 800 speed, type M generator, complete and in A1 condition.

1—80 KW., 125 volt, Crocker-Wheeler, 750 speed, type CCD generator.

1—90 KW., 110 volt, General Electric, 690 speed, type CL, 6 pole, form B generator.

1—300 KW., 550 volt, General Electric, 400 speed, type MP generator, D.C.

BOILERS

3—300 H.P. Holyoke Manning Boilers, now located in Massachusetts; good for 150 lbs; 11 years old, in splendid condition.

5—150 H.P. Manning Boilers, now located in New Hampshire; good for 135-140 lbs. Immediate delivery.

6—90" x 18' 6" horizontal return tubular Dillon Boilers, now located in Rhode Island, installed in 1905, for delivery in 2 months.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL
The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"
Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"
Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"
Fire-resisting paint, or colorless solution.

"ARMACELL"
Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"
Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"
for coloring electric lamps. Used in the Royal Navy. Weatherproof. Dries rapidly.

"ARMABRON"
Bitumen protective paint, elastic, acid-resisting, weatherproof.

ERICO
Featherweight Portable Welder

The Rheostat shown above weighs 140 pounds, and the Welder weighs 65 pounds. The outfit installs standard ERICO Rail Bonds, and will operate on voltages between 250 and 750.

No flame or arc strikes bond or rail.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:
"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

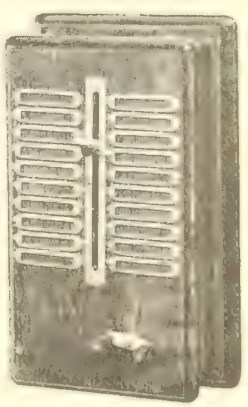
Water Turbines

Hydraulic Governors

High Efficiency Pumps

Vertical Turbines

shown in the accompanying illustration were designed and manufactured by us for the Hydro-Electric Power Commission of Ontario. They are among the largest water turbines installed in Canada and are characteristic of the high efficiency of our engineering department.



The services of these experts are at your disposal to consult on any of your engineering troubles.

BOVING HYDRAULIC & ENGINEERING CO., LIMITED

LINDSAY - ONTARIO

LOSING MEN

It is easy to lose track of a man in a plant of more than two departments. Just when you want him you cannot find him. Sometimes important matters are delayed while you are looking for the man that knows the details.

FINDING MEN

in a plant is also easy after you have installed a Presto-Call System. The Presto-Call is a Signal Service that we make in three sizes to call 5 men, 10 men or 20 men. It is easy to operate, and moderate in price; works with either vibrating or single stroke bells, or horns. The Presto-Call pays for itself in a few months.

Write for Booklet.

SQUARE D
STEEL ENCLOSED SWITCHES

Primarily there are two contributing factors in accidents to workers and machinery—carelessness and ignorance.

In their relation to the great industrial hazard—*the electrical danger*—both of these elements can be effectively provided for only by positive protective measures. Merely warning of the danger—because of its very nature—is of little avail.

The protective value of the Square D Switch cannot be overestimated because—all live parts are completely enclosed—it is operated by handle outside of box—lock-off device guards against accidental closing of circuit—switch may be locked so that none but authorized persons have access—it may be inspected without interrupting service.

Square D Switches are standard in many of the largest plants—why not in yours?

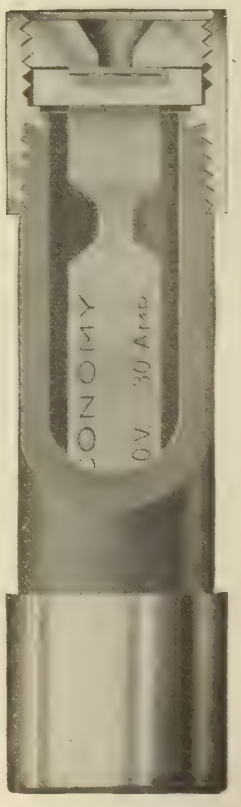
ECONOMY

RENEWABLE



FUSES

protect millions of circuits and billions of dollars worth of property in thousands of plants representing every branch of industry.

They are used by the U. S. Navy, leading powder and munitions plants, ship yards, steel mills and others who put accuracy and safety before anything else.

They cut annual fuse maintenance costs 80 per cent., because an inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

No special tools or experience needed to replace the link and renew the fuse. Anyone can do it in a jiffy.

Order from your Jobber. Ask for Catalog 20.

ESTABLISHED 1849
BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.
THOS. C. IRVING,
Gen. Man. Western Canada, Toronto.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a **Specialist in Repairs.** Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants **quick work** and an **absolutely reliable job.** You can give it to him.

Make up your mind **now.** Say **"I'm going to get something out of the next repair job in this town."**

You have the work of taking out and re-installing the machine **(Profit).** Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the **Trade Discount (More Profit).**

Others are doing it. Why not you? Write about it.

3,500 lb. Cylinder of Shell Press

Reclaimed by

Oxy-Acetylene Welding

Here are two repairs by Oxy-Acetylene Welding which show the enormous savings effected by welding "breaks" as they occur, and restoring broken machinery to immediate use again.

This 3500-lb. Cylinder of Shell Press was out of commission only a comparatively short time, although the damage, as may be seen by the welded part, was extensive.

When the work was completed it was tested to 2000 pounds per square inch Hydraulic pressure with satisfactory results. Cut also shows an Aluminum Crank Case of an Automobile reclaimed by welding.

There are many similar uses for the Process in Your Industry, with a corresponding saving of time, money and material. Write for particulars.

See these profitable specialties

The Original "Arnold" Vibrator

"Arnold" Electrical devices for home and business are live, up to the minute profit makers and will be good business bringers for you. Priced right and sure to give satisfaction. The public are greatly interested in Vibrators at the present time. The Arnold is a simply constructed machine that is practical in use and will be found very beneficial in building bodily strength. Our illustrated literature will give you all details.

"Arnold" Electric Hair Dryer

The Arnold Dryer will find a ready market in the home, shoe shine and barber shops, factories and stores. It is effective and fool-proof. The designing is such that it is safe to use at all times and in every possible place. Send for literature.

The Best Known Cable Reel in Canada

In Halifax or Vancouver, whether on the public thoroughfares of our larger cities or smaller towns, wherever there is a cable installation in progress, the reels invariably bear the name of the Northern Electric Company, Limited.

The installation may be overhead, underground or submarine. It may be for a Telephone Company, a Telegraph Company, a Railroad Company, or for a street lighting system.

The quality, both of the product and the service, is largely the reason for the universal demand for Wires and Cables of Northern Electric manufacture.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Where are they?

It has been stated that hundreds of thousands of the useful electrical appliances sold, such as irons, etc., are not used at all, while other hundreds of thousands are used only on rare occasions. Why?

There is No Convenient Place to Attach Them

This is a startling condition.

To the central station it means a loss of revenue.

To the manufacturer, jobber and dealer it means that there is a vast number of unused appliances standing as a barrier in the way of further sales.

"I have no place to attach them," says one.
"It is inconvenient to take out a lamp," says another.

What can we do?

How can we remove the obstacles to more revenue, greater sales, greater use of electrical household appliances? The easiest, simplest method of providing an extra outlet, both for emergency and everyday use is the

Benjamin

TWO-WAY PLUG

MADE IN CANADA

Supplies an extra outlet that is used, because it is put on at a point where more service is needed.

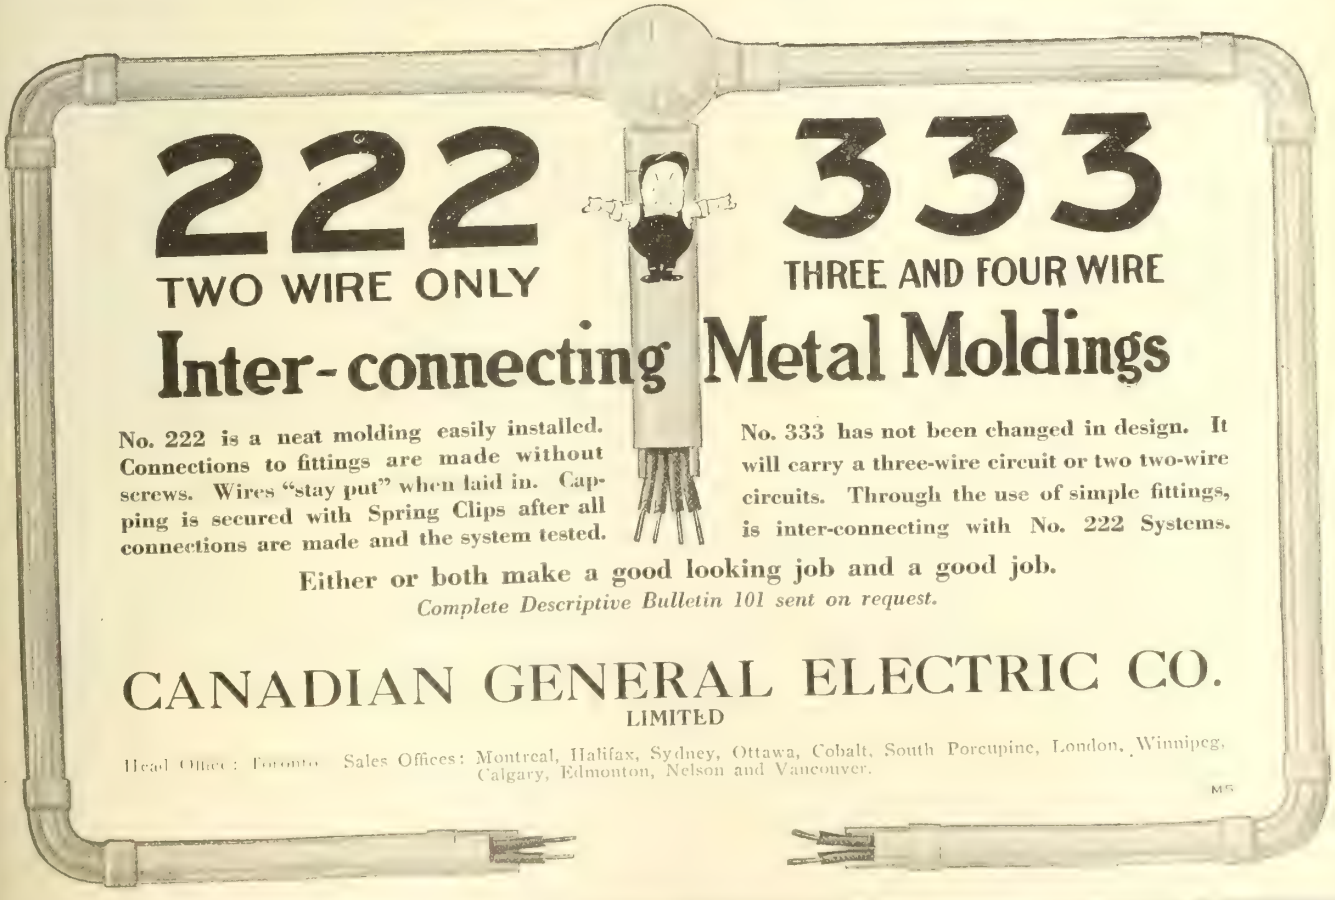
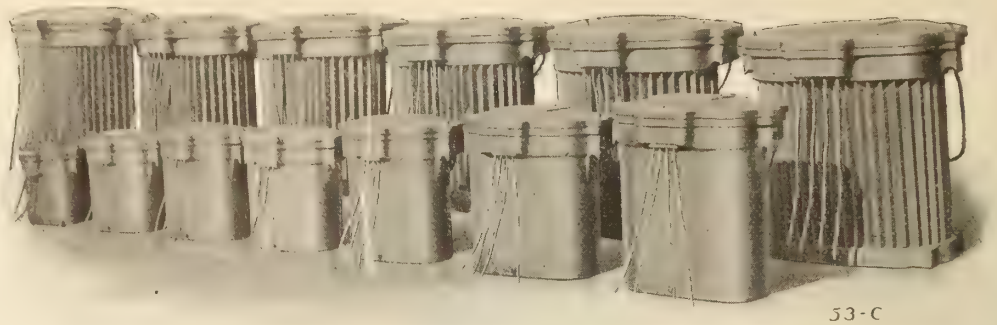
Sprague
PANELBOARDS AND CABINETS

Type CEO.
No. 1. Type CEO.—This panelboard is furnished with either 2 wire or 3 wire mains, having 30 ampere knife switches and N. E. C. enclosed fuses in the branches.



Particular attention is called to the new Sprague "Safety Type" Panels which have been developed to meet the demand for a high grade dead front Panelboard providing absolute safety even to the most careless operator. In this Panelboard the switches, either of the pushbutton or rotary type, are grouped closely together and occupy a small space in the centre of the Panel, protected by a cover furnished with a spring catch.



Access to these switches is obtained by opening a smaller door which is hinged on the large door of the Cabinet. By this arrangement any person may have access to the dead front switch compartment, but access to the compartment containing fuses and other current carrying parts is confined to persons entrusted with key to locked door covering this compartment. All parts subject to wear are removable from front of panel and can be replaced without adjustment.

Type PPO.
Fig. No. 2. Type PPO.—This panelboard is furnished with either 2 wire or 3 wire mains having 10 ampere push button switches enclosed in composition covers and plug fuse receptacles in the branches.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price $6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated. Price 65c.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

ELECTRICAL NEWS, 347 Adelaide St. W., Toronto, Ontario

Robbins & Myers Fans

A NOISY machine is nearly always an inefficient machine, for noise usually indicates wasted power and wear and tear on the machine.

In the case of the Electric Fan, noise is especially objectionable, as a Fan is used in the home, office, theatre, and other places where noise is disagreeable and detracts a lot from the comfort derived from the fan.

Listen to any Robbins & Myers Fan in operation. You'll get a striking demonstration of one of the features which make R & M Fans so popular with users and such easy sellers for the dealer.

They are constructed so that the power is utilized to the maximum limit in circulating the air. Mighty little energy is wasted in useless churning of the air and production of noise.

Demonstrate this feature to your customers. It will make many R & M Fan sales for you

L. Larsen

Manager, Buffalo Sales Office.

ADVERTISEMENTS

Orders for advertising should reach the office of publication not later than the 5th and 20th of the month. Changes in advertisements will be made whenever desired, without cost to the advertiser.

SUBSCRIBERS

The "Electrical News" will be mailed to subscribers in Canada and Great Britain, post free, for $2.00 per annum. United States and foreign, $2.50. Remit by currency, registered letter, or postal order payable to Hugh C. MacLean, Limited.

Subscribers are requested to promptly notify the publishers of failure or delay in delivery of paper.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 27 Toronto, June 1, 1918 No. 11

Water Powers Should Be Developed Without Delay

Recently the Commission of Conservation placed itself on record "as being opposed to the granting of permits to private interests to develop water power on the St. Lawrence River. In its opinion these powers should be developed by an International Commission, which would utilize the maximum amount of power in the most economical manner possible, and make it available to the neighboring and tributary population of Canada and the United States upon fair and equitable terms."

There can be no quarrel with this suggestion of an International Commission to control the waterfalls of the St. Lawrence or any other boundary river, and another Commission, working in sympathy with it, to control inland water powers. It is not so evident, however, that the word "developed" is the happiest that could have been chosen. It smacks not only of government control—which is right—but also of government development and operation, which, as we have learned in Canada, is not always so desirable. The function of an International Commission should be that of an organizer, not an operator. Its business it should be to see to it that the power is developed—developed economically and keeping the needs of the future, as well as the present, in view; that the power is distributed where it rightly belongs and where it will do us, as a nation, the most good; and finally, that this power should be utilized economically and in such a way as to ensure greatest commercial development to Canada at large. The working out of these plans in detail, however, is scarcely the work of this Commission. The building of plants is a problem for engineers; also their operation; also the utilization of the power in developing industries. It also remains to be proven yet that such undertakings do not thrive best under private management—not private management with unbridled license or franchises that make the undertaking a financial gamble, but under proper control such as is easily feasible and, after the experiences of the past few years, readily acceptable to all parties.

By all means let us have such a Commission and set them to work without a moment's delay. Let it be composed of men who are acknowledged administrators, men with a vision of Canada's future, men who have no desire to tie themselves down with the petty details of development and application of electricity, but who will know how to pick men to attend to these details. There does not seem to be the slightest doubt that Canada can use her water powers as rapidly as they can be developed. Irrespective of the duration of the war, power will be in demand in rapidly increasing quantity. If the United States will co-operate—and why should they not—why not get this Commission in action without further loss and delay?

The Electric Fan A Year-round Utility

The value of the electric fan in summer is generally recognized, but its winter use is very far from general. This is largely, we believe, because its value is not recognized by the average householder. The latest developments in medical science seem to point to the value of keeping the atmosphere in which we live constantly in motion, and a stagnant atmosphere, we are told, is the cause of unhealthy and poor working conditions, much more than the presence of carbon-dioxide or any other poisonous gas in the air. If this is so, the electric fan should be found in every room where human beings congregate and endeavor to use their brains.

The writer of an interesting article in the Electrical World, Mr. Charles Catlett, emphasizes another point in connection with the use of the fan which is very slightly appreciated—that is, that the temperature of the upper part of the average living room is very many degrees higher than the temperature of the lower strata of air. In a general way we have all realized this fact in that it is usually our lower extremities that bother us most when the temperature of a room falls below normal. Mr. Catlett quotes temperature figures to show that in a room approximately 10 feet high, when the temperature at the ceiling is 83 degrees F., the temperature at the floor may be as low as 62 degrees F. His tests showed that at the time there was a sufficient quantity of heat in the room to render the whole area approximately 74 degrees, which is considerably in excess of what most people consider necessary or desirable. The trouble, as he says, is that if a person were sitting down in this room his feet would be at a temperature of about 62-63 degrees; the centre of his body about 67 degrees, and his head slightly above 70 degrees. If he stood up his head would be about 75-76 degrees. Further, the space above his head, which is ordinarily three to four feet, would be considerably above normal temperature, and yet the heat in this area is performing no useful purpose whatever.

Temperature Figures at Various Heights

Height.	Temperature.	Height.	Temperature.
124	83	14	74
108	80	31	68
93	80	4	66
64	76	0	62

There can be no question but that an electric fan, or some other means of agitating and mixing the air, would be of the greatest service under these conditions. A tem-

perature which appears to the occupant to be around 62 to 65 degrees can be changed to 70 degrees or more by the use of an electric fan. The economy in coal is self-evident. In addition we should be following the medical practitioner's admonition to keep the air in the room well mixed. As a combination solution for purifying a stagnant atmosphere and conserving coal, the electric fan seems to give the greatest promise. If these important items were brought to the attention of the average consumer the use of fans would doubtless become much more general.

It is true that these are times when electric current must also be conserved and at certain points in Canada no effort is being made at the moment to sell current-consuming devices. The fan, however, might well be taken as an exception on account of its almost insignificant current consumption. Its more general use would appear to represent the greatest amount of good with the least amount of expenditure of essential energy.

The Electric Club of Toronto Closes Successful Year

The Electric Club of Toronto brought to a close a most successful season on Friday, May 10, when the regular annual meeting was held for the purpose of electing officers, revising by-laws, etc. Mr. Frank T. Groome, president for the past year, received a very cordial reception after his past illness and showed that he had lost none of his former optimism and vigor. The Club, under Mr. Groome's presidency, has made a splendid record and has established itself as one of the essential institutions of the city of Toronto.

During the year the members have met every Friday at noon to lunch together and listen to addresses by prominent men of the city and elsewhere. In the choice of speakers the committee having this matter in hand have been particularly fortunate, in that they were able in every case to get men of outstanding ability in their particular line. A list of the various speakers is given herewith in the approximate order in which they were the guests of the Club:

Rev. Father L. Minehan—"The Irishman Outside Ireland."

Sir Robert Falconer—"The University and the War."

Harbor Inspection—At the invitation of Mr. E. L. Cousins, general manager and chief engineer.

Hon. Mr. Justice Sutherland (Late Speaker, House of Commons)—"Professions."

Frank Stockdale—Advertising.

Arthur Hawkes—"Relations between Ontario and Quebec."

Jos. E. Atkinson (President Star Publishing Company)—"After the War—Industrial Changes."

Prof. H. E. Haultain—"Vocational Training of Returned Soldiers under the Military Hospitals Commission."

Prof. A. P. Coleman—"Recent Visit to South America."

Mr. E. N. Hyde (Montreal)—"Illumination."

Mr. Z. A. Lash, K.C.—"Courts of Law and Equity in Canada."

Major Robert F. Massie, D.S.O.—"The Canadian Attacks upon and Capture of, Passchendaele."

Mr. M. A. Sorsoleil (Principal Normal Model School)—"The Rise and Fall of Germany."

Col. Geo. G. Nasmith, Ph.D., C.M.G., "Keeping the British Soldier Fit."

Prof. Alfred Baker—"Need we fear the financial strain of the War?"

Col. Gordon Morrison—Some Front Line Experiences.

Mr. Arthur V. White—Our International Waterways.

Prof. G. M. Wrong—"Some Aspects of the German Constitution."

Prof. J. C. Fields—"Industrial Research Work in Some of the Best United States Laboratories."

Mr. H. MacDonald (Canadian Manufacturers' Association)—"True and False Advertising."

Prof. St. Elme de Champ——"Alsace-Lorraine."

Lieut. R. W. Harris—"Military Mining."

Lieut.-Col. Cecil G. Williams—"The Empire's Navy, Its Growth and Problems."

Mr. McGregor Young, K.C.—"Future of International Law."

Principal W. L. Grant (Upper Canada College)—"Some Educational Experiments."

Rev. Prof. J. H. Michael—"Lloyd George."

The treasurer reported that the fee of $1.00 did not allow a sufficient margin for necessary expenditures in connection with the weekly meetings of the club and a motion was carried making the membership fee $2.00 for the coming season.

The election of officers for next year resulted as follows:—President, K. J. Dunstan, manager Bell Telephone Co.; vice-president, D. H. McDougall, manager Toronto Electric Light Co.; secretary, Frank Kennedy, Toronto manager Bell Telephone Co.; treasurer, H. D. Burnett, engineer Canadian General Electric Co.; with the following committee: H. H. Couzens, general manager Toronto Hydro-electric System; R. T. Jeffrey, engineer Hydro-electric Power Commission of Ontario; R. D. Perry, general manager Great North Western Telegraph Co.; L. C. Horner, manager Supply Department, Canadian General Electric Co.; Geo. D. Leacock, sales manager Moloney Electric Co. of Canada; W. R. Ostrom, sales manager Northern Electric Co.; C. H. Hopper, Canadian Westinghouse Co.; Geo. Paton, general manager C. P. R. Telegraph Co.; Walter R. Carr.

Professor Evans on "Chemical Research" Before Montreal Luncheon Club

The members of the Montreal Electrical Luncheon concluded a very successful season on May 15th, when Professor N. N. Evans, of McGill University, spoke on "Chemical Research," particularly in relation to the war, and on the imperative necessity of general and technical education in competing for the world's trade.

Prior to the talk, Mr. T. H. Chennell, the secretary, submitted the second annual report of the luncheon, which was inaugurated in February, 1916. From a beginning of seven members, the roll, he said, had now attained a list of 293. The average attendance of the season was 58, the highest attendance being 118. Out-of-town guests numbered 99. Twenty-eight meetings were held during the season. No membership fee was charged, and in order to meet the expenses $77.25 was collected, and $95 contributed by companies when employees attended the luncheon. With other contributions, the total income was $179.22, while the expenses were $168.70, leaving a balance of $10.52. The report also expressed appreciation of the action of the newspapers and magazines in publishing reports of the proceedings.

On the motion of Mr. Randall, seconded by Mr. Wood, the report was adopted, Mr. E. N. Hyde suggesting that the Electrical News be included in the magazines referred to, adding that the reports of the Electrical News had been very accurate.

A vote of thanks was passed to Mr. Chennell, Mr. W. H. Winter, who presided, stated that Mr. Chennell had done splendid and enthusiastic work for the luncheons. In the fall the members would have to consider the question of reorganizing the luncheons, which were now carried on without a permanent organization. Montreal had given Toronto the lead in the matter of luncheons, and he understood that Toronto had now a particularly live association.

Professor Evans, in the course of his speech, referred to

the chemical research which had been the direct outcome of the war. Prior to the conflict Canada had depended for many chemical commodities upon Germany, and the war had naturally cut off these supplies. The country had therefore to set to work to produce these commodities for ourselves. Chemists had a long way to catch up, as the Germans had taken a strong lead, and many people were obsessed with the idea that Germany was capable of doing things which this country was not able to do. But there were others who did not hold this belief, and it was wonderful what had been accomplished in a very short time.

Prof. Evans then sketched the results which had been the outcome of research work. He instanced the manufacture of optical glass in the United States, which had formerly depended upon Germany for the supplies of this glass. It had been found necessary to discover sources of raw materials, the most suitable sand for the purpose being previously obtained from Belgium. A long series of experiments were undertaken, with the result that the United States were producing excellent glass in many varieties which was as good as that formerly imported. Just outside Washington there were about 500 chemists working on the subject of poisonous gases. Prof. Evans mentioned that mustard gas was discovered by a German, and the United States were now manufacturing this gas and sending it in large quantities to the nation which discovered it. These chemists were also at work on the subject of discovering antidotes to poisonous gases.

In connection with munitions, a large amount of chemical research had been carried out. At McGill University experiments had been made on t.n.t., particularly in relation to the solubility of the liquor in which it was produced, and how to conserve that liquor; also as to purifying the materials and making them stable. Considerable work had been done in connection with steel.

With regard to acetone, they all knew what large quantities were being produced by the Electro-Products Company at Shawinigan Falls. In fact the development in connection with the production of acetone was one of the most wonderful things in connection with the war.

Referring to potash and its use as a fertilizer, the speaker stated that formerly the main supply came from Germany. There were immense supplies of potash in Canada, but unfortunately no method has yet been found by which it could be economically produced from the rock. On the subject of nitrogen, Prof. Evans spoke of the success of electrical fixation in Norway and Sweden. The Germans, too, were producing nitric acid from the air, and he had been informed that the United States were just as successful as Germany in obtaining nitric acid by the fixation process.

It had been asked why Germany had gone so far ahead in chemical research. One reason was the Gearmans were a people of wonderful patience. In Europe the people stuck to a business from generation to generation, while on this continent they jumped from one business to another. Another reason for the progress in Germany was the thoroughness of ordinary and technical education. One could not have research work unless it were built on something, and that something was education. Canadians would have to submit to that spirit of thoroughness if they were to successfully compete for business. It was of the utmost importance that our people should know more than one language. We ought to concentrate upon our work. These were some of the reasons why we had fallen behind, at any rate so far as chemistry was concerned. There had been much discussion as to imposing heavy tariffs, but in his opinion if we were to keep our trade, there was only one way to do it, and that was by making goods as well and as cheaply as other countries; otherwise we would not keep the business.

Votes of thanks were passed to Mr. Winter, the chairman of the luncheons, and Mr. E. N. Hyde, chairman of the papers committee. In reply Mr. Winter said he believed there was an important future for the luncheons, and he was looking forward to a permanent organization which would bring larger developments.

Commission of Conservation Issue Ninth Annual Report

The Ninth Annual Report of the Commission of Conservation is out and contains, as usual, a quantity of useful and interesting information regarding Canada's resources. It is in effect a report of last November's annual meeting, and contains the papers read and reports presented at that time. The papers include discussions on such topics as "Peat," by Eugene Haanel; "Fuel Situation," by C. A. Magrath; "Power Possibilities on the St. Lawrence," and "Niagara Power Shortage," by A. V. White; "Electrification of Railways," by S. T. Dodd. The papers have already been treated in more or less detail in previous issues of the Electrical News. A brief report by Mr. Leo G. Denis, however, had not previously been published and it is of interest as outlining in some detail the work the Commission has under way. Mr. Denis' report is, therefore, printed in part below:

Waters and Water-Powers

Special efforts were made during the past year to secure descriptive information on electric power plants and systems throughout the Dominion for a report to be published shortly on the supply and distribution of electric energy in Canada. The importance of this subject as related to our water-power resources need scarcely be enlarged upon. Without the impulse given by the possibility of transmitting power over long distances, water-powers would not have attained the high place they now occupy among the various natural resources of a country. Long distance transmission of energy is only possible through the medium of electricity and, while some large developments, notably in the paper and pulp industry, make direct use of water-power, practically all other developments of importance are for the production of electrical energy.

The report will give a short description of all electric central station systems, including power plants, transmission lines and distribution, each system being described individually. In previous reports respecting this subject, the Canadian data have been appended to United States reports and treated as secondary. Their incompleteness has created a false impression to the detriment of this country. This is simply due to the fact that complete information covering the Dominion has not, thus far, been collected. The production of electric energy in Canada is one of the developments to which we can point with pride and the data thus far received demonstrates that, in this respect, we are behind very few countries, if any.

The greater portion of the information has been collected by correspondence, under the direction of your Water-power Engineer and your Mining Engineer. The various questionnaires sent out in this connection included the following items:

Hydraulic Plants.—Dams and hydraulic works; available head, flow of river, hydraulic troubles, power houses, turbines, generators and transformers, demand and output, interruptions to service, costs and date of installation.

Steam and Internal Combustion Engine Plants.—Power houses, boilers, gas producers, engines and turbines, generators, fuel, costs and date of installation.

Transmission Lines.—Location, voltage, capacity, construction, protection and sub-stations.

Distribution.—Purchased energy, station transformers

output, mileage of streets covered, voltages, line transformers, connected load, street lighting, costs and rates charged.

Another subject receiving attention is the revision of the list of developed water-powers in Canada as published in the report of 1911. The developed water-powers are increasing in number and, as no detailed complete information has been published since the report above referred to, it seems most desirable to have the data brought up to date. The Commission is constantly receiving inquiries on various phases of this subject. From time to time, estimates of developed water-powers for the whole Dominion or for certain portions of it have been made but these are of little value unless specific information respecting each power included in the estimates is given. The publication of a detailed list also permits any grouping which may seem desirable.

Routine work included the preparation of a number of short articles having reference to our water-power resources and also brief reports on special subjects, including possibilities of water-power sites, rates for electric energy, data on discharges of rivers, industrial statistics, certain water-powers of the Prairie Provinces, bibliography of Canadian water-powers, general water-power situation in Canada, water filtration plants in Canada, and electric energy required for various purposes.

Coteau Dam Project

A report was prepared on the proposed scheme to dam the River St. Lawrence for the development of power at the Coteau Rapid at the foot of Lake St. Francis. Apparently, the principal object of the project is the exportation of electric energy from Canadian water-power. Permission for such a development would be in violation of the recognized principle that no further development should be allowed on the St. Lawrence between Prescott and Montreal until a comprehensive plan of development for that portion of the river has been decided upon. The necessity of this is emphasized by the conditions at Niagara. There, the development by the Ontario Hydro-electric Power Commission will utilize the entire head, including the lower rapids, instead of being limited to the descent in the cataract proper, as has been the case with all the power so far developed. It is also proposed to "scrap" some or all of the existing plant which, if carried out, will involve the destruction of many millions of invested capital.

Champlain Dry Dock, Quebec, Electrically Operated Throughout

In a paper on the Champlain drydock for Quebec harbor, read at the Canadian Society of Civil Engineers, Montreal, Mr. U. Valiquet, M.Can.Soc.C.E., superintending engineer, Department of Public Works, briefly described the electrical equipment for the working of the dock. He stated that three main centrifugal pumps, each of 63,000 gallons per minute capacity, are used to empty the dock; two pumps of 6,000 gallons per minute each are used to keep the dock dry. All pumps are run by electric power. Eight boilers, of a total capacity of 3,600 horse-power furnish the steam at 200 pounds pressure to run the three direct current turbo-generators of 1,500, 750, and 300 kilowatts respectively, which furnish the current at 550 volts to run the pump and other motors.

A direct current generator of 100 kilowatts, at 220 volts, driven by a steam engine, will furnish the current for the lamps around the dock and in the buildings. There are 24 lamps of 500 watts, hung from poles around the dock. The poles are made of gas pipe, with the lower end set into sockets fitted with electric connections and made removable in case of necessity. All electric wiring for lamps and motors outside of the buildings is placed underground.

There are nine electrically-driven capstans, with 15 h.p. motors, four on each side of the dock and one at the head. The rolling caisson is provided with six culverts, 42 inches in diameter, closed by sluice valves that are operated from the upper deck by a 15-horse-power electric motor, driving a longitudinal shaft, provided with the necessary gearing; and, by means of clutches, any one or all of the valves may be worked. The culverts are used for flooding the dock.

Six water tube boilers of 500-horse-power and two of 300-horse-power furnish steam at 200 pounds pressure to produce electric current. The boilers are provided with automatic stokers, ash and coal conveyors. The coal is unloaded from cars into a coal crusher run by an electric motor and elevated to a hopper of 500 tons capacity, over the front of the boilers. Water heaters are provided, but the steam is not superheated; one of the small boilers will be constantly under steam pressure to run the drainage pumps and the lighting dynamo

The electric power consists of three direct current turbo-generators of 550 volts, one of 1,500 kilowatts, one of 750, and one of 300 kilowatts. The steam turbines are of the Curtis condensing type, built by the General Electric Company. In the large unit the turbine runs at 3,600 r.p.m. It is geared down to 360 revolutions for the generator; the second is geared from 5,000 to 750; the third is geared from 5,000 to 900 r.p.m. A 100-kilowatt generator, driven by a high-speed, direct-connected engine, furnishes the current for lighting purposes.

This power installation is more than ample for all the machinery connected with running of the dock proper. It is, however, anticipated that the whole of it will be used when large repairing and shipbuilding shops are in operation, together with the pumping of the deck.

This electric installation has been criticized on the ground that the large expenditure is not justified when electric current is available from private companies in the vicinity of Quebec. When the electric installation was proposed by the writer the idea in view was that no company would be interested or willing to furnish over 3,000 h.p. at any time of the day or night for the short period of about 50 hours in the year without interfering seriously with their general service. It had also been ascertained by personal visits to five of the principal navy yards of the United States Government that each of them has provided its own electric power for pumping their drydocks. Out of five, only one had installed alternating current machinery. It has developed since that the only electric company that could furnish the power current is not willing to entertain the proposition unless at a much greater cost to the government than the private installation can be run, including the interest on the outlay, which is approximately $240,000.

The dock is emptied by three main pumps of the horizontal centrifugal type, each having a capacity of 63,000 gallons per minute. The bronze shafts are connected to the armature shafts of 800-horse-power motors, running at 750 revolutions per minute. The motors are built to stand an overload of 25 per cent. for two hours; the total lift will very rarely be more than 33 feet. The suction and discharge pipes are 48 inches; the water is discharged into a chamber provided with non-return valves, and to a culvert through the entrance wall outside of the caisson. The main pumps are guaranteed by the builders to deliver 63,000 gallons per minute against a total head of 25 feet.

Two auxiliary pumps each of 6,000 gallons per minute capacity, driven by electric motors of 125-horse-power, will take care of leakages and seepage. These pumps will also help while the dock is being pumped. The pumps were manufactured by the Allis-Chalmers Company.

The time occupied in emptying the dock will vary according to the height of tide when the pumps are started and the size of the vessel being docked. At high water of spring tides the dock contains over 38,000,000 gallons of water This

quantity of water, however, will very rarely, if ever, exist when pumping is started. It is estimated that the average time for pumping out the dock will be about two and a half hours.

The power-house is 120 x 100 feet, divided by a brick wall into two rooms, 120 x 50 feet, one being the boiler-room and the other the generator-room. The walls are solid brick, built on concrete foundation; the roof is built of reinforced concrete slabs, supported by steel I-beams, which were procured from the unused steel of the first Quebec Bridge. The building is provided wih extra large windows, with steel frames Skylights and ventilators are also provided. The floor is concrete overlaid with red tiles; and the lower part of the interior walls for the generator-room is finished with a white tile wainscoting 6 feet high. The generator-room has an overhead travelling crane of 15 tons capacity. The lifting is done by motor; the travelling gear is worked by hand.

Cos Figures on Generating Station $70 per Kw. for Completed Plant

It is always difficult to get accurate construction figures on electrical installation work, and for that reason a short article appearing in a recent issue of the Electrical World, giving the itemized cost of construction of a Massachusetts central station, is of timely interest. The cost includes the building, which is designed for one 500 kw. and two 2,000 kw. turbo-generators. Only the 500 kw. and one of the 2,000 kw. generators is installed and included in the cost, which covers building, boiler, coal handling and piping installations adequate for the completed 5,500 kw. The total cost of the plant is $269,000 and it is estimated the second 2,000 kw. unit can be installed for about $40,000, a total of $309,000, or about $70 per kw. The itemized cost of the plant, as at present built to 2,500 kw. capacity, is as follows:

Land

Land	$25,000	
Docks, walls and filling	4,271	
Legal expenses for do	348	
Surveying for do	43	
Dredging and intake	3,035	
		$32,697
Preliminary engineering investigation		7,000

Building

Sub-surface foundations	$9,040	
Steel for station building	18,080	
Superstructure	27,641	
Stack, 200 ft. high, 9 in. inside diameter	6,954	
Steam heating	772	
		62,851

Service Equipment

Coal and ash handling	$11,594	
Coal and ash bunkers	3,063	
Water supply and storage	353	
Oil filters and storage	48	
Crane	1,588	
		16,646

Boiler Plant

Four 342-h.p. B. & W. boilers with superheaters and settings	$24,074	
Four Taylor underfeed stokers and drive	8,664	
Flues and air ducts	459	
Pumps—turbine-driven duplicate set	2,597	
Blowers—turbine-driven duplicate set	1,674	
Feed-water heater (1500 b.h.p.)	866	
Instruments and regulators	1,092	
		39,426

Piping for 4500-kw. Rating

High-pressure steam piping, steel valves and fittings	$4,222	
Exhaust steam piping, valves, fittings, etc.	2,278	
Water and oil piping	1,304	
Condenser piping, outside building	9,337	
		17,141

Turbo-Generator Plant, 2000-kw. Unit

(500-kw. unit from old station, see later section)

Turbo-generator, 2000-kw. rating, 80 per cent. power factor	$22,904	
Surface condenser, 3,500 square feet	9,054	
Condenser piping, inside	1,423	
Air supply and cleaning	935	
		34,315

Switchboard and Electrical Equipment

Switchboard, oil switches, instruments, etc.	$12,567	
Exciter and 100-kv.a. auxiliary three-phase transformer	2,393	
Municipal station apparatus	21	
Station wiring	1,075	
Connections to overhead lines	5,400	
		21,456

Miscellaneous

Interest during construction	$3,706	
Fire insurance	680	
Liability insurance	162	
Steam coal used during building and in tests	1,031	
Miscellaneous material, apparatus, tools, hardware, etc.	1,569	
Unclassified labor, watchmen, foremen, etc.	1,817	
General expenses, unclassified	410	
		9,375

Engineering

Engineering architect	$6,300	
Field supervision	2,860	
Drafting and blueprinting	1,858	
Drafting and office expense	259	
		11,277

500-kw. Turbine Transferred from Former Station

Turbo-alternator, 500-kw.	$10,000	
Piping for turbine	2,752	
Wheeler condenser (second-hand)	1,000	
Air and circulating pump	1,435	
20-h.p. Terry steam turbine	425	
25-kw. direct-current motor-generator exciter set	1,220	
Instruments	85	
		16,917
Total		$269,101

The Alberta Hydro-Electric Company Planning a Series of Six Developments

The Alberta Hydro-electric Company, Limited, Calgary, recently called tenders on the construction of a series of dams and hydro-electric developments in connection with some half-dozen water falls in the immediate vicinity of the city of Calgary. The total fall in the Bow River at this point, over a distance of 10½ miles measured along the river, is 120 feet. This is divided approximately into six falls, two of which are located within the city limits. Roughly the heads and capacities of these various falls are as follows, it being estimated that the flow of water is 2,000 c.f.s.:

No. 1—head 21 feet, maximum development	3,818 h.p.
No. 2—head 20 feet, maximum development	3,636 h.p.
No. 3—head 12 feet, maximum development	2,181 h.p.
No. 4—head 17 feet, maximum development	3,091 h.p.
No. 5—head 12 feet, maximum development	2,182 h.p.
No. 6—head 17.5 ft., maximum development	3,182 h.p.
Total development	18,090 h.p.

The above information has been supplied to us by Mr. Zeph. Malhiot, vice-president and manager of the company, who advises that the reason for the series of dams, rather than one or two large ones, is that this plan will obviate the inundation of certain city areas. The calling of tenders is not to be interpreted that the plan will be carried out immediately. The question at the present time is one of financing. Calgary needs the power but the problem of securing capital for new projects is no more easily solved in that city than elsewhere.

Transmission Line Practice—Modern Systems—Article VI.

By Lieut. E. T. Driver and E. V. Pannell

It is interesting after studying some of the factors of transmission line design to review briefly some of the more important and extensive installations in different parts of the world to see how far actual practice is consistent with the theories outlined. A brief survey has been made of a few modern transmission lines in the United States, Mexico, India, South Africa, New Zealand, Japan, and Germany. Beginning with American practice, one of the most important systems is that of the

Mississippi River Power Company

The Mississippi River Power Company, generating power at a 30 ft. head on the Mississippi River, near Keokuk, Ia., and transmitting at 110,000 volts, 25 cycles, to St. Louis, Mo., 144 miles away. As with all transmission systems, there are branch lines to different distributing points, but the main interest centres in the trunk lines to St. Louis. Conductors are copper, 300,000 c.m. in size, strung on spans of 800 ft. standard length; this long span is one of the remarkable features of the line. Ten years ago the average span of tower lines was about 500 feet, and curves showing the most economical span length generally have their minimum point at about 600 feet. The advantage of longer spans than this is that the number of insulators is still further reduced, and the right of way charges are also probably lower.

Over each of the two circuits about 34,000 kva. is transmitted, a total which, considered with the long spans and river crossings, the large size of conductors, and the very tall towers, renders the Mississippi transmission line almost unique for the boldness with which it has been engineered. The maximum power of any long distance transmission line is probably conveyed by the Cedars Rapids Manufacturing and Power Company, along the double circuit line from Cedars Rapids to Massena, N.Y.

Cedars Rapids Line

A total of about 40,000 kva. per circuit is carried a distance of 60 miles to the electro-chemical factories at Massena at 110,000 volts, 60 cycles. The conductors are aluminium-steel, 500,000 c.m., carried on double-circuit towers, with a span of 660 feet. This combination probably calls for the heaviest standard tower in general use, the average weight of these structures being 7,000 pounds. There are three general types of tower in use; suspension towers are designed to stand with two conductors broken on one side and maximum wind and ice loads. Anchor towers are designed for the same stress, but are equipped with strain insulators. Dead-end and corner towers are designed to stand with all conductors broken and maximum wind and ice conditions. Since the elastic limit on this size of aluminum-steel cable is 12,000 pounds, the failure of six cables leads to the enormous unbalanced pull of nearly 72,000 pounds on the dead-end tower. Such a failure is in the last degree improbable with these steel core cables. Nevertheless, it forms the basis for the tower design, and, with the liberal factor of safety, this is the most heavily-constructed long-distance transmission line in existence. In more southerly latitudes it will be seen that construction is much less rugged, because the absence of sleet involves lower stresses and tower loads. A typical modern southern transmission undertaking is that of the

Tennessee Power Company

From Cleveland, in the Cumberland Mountains, to Nashville City, is 140 miles. Power is generated at a 250-foot head and transmitted at 120,000 volts, 60 cycles, the kva. per circuit being about 20,000. The greater part of the line is constructed with two single-circuit tower lines, having the conductors hung in the horizontal plane. The conductors are 2/0 B & S copper, and the spans 660 feet.

The adoption of the two separate circuits is a valuable factor in reliability. In the first place, the spacing can be more liberal, thus quite eliminating corona loss and short circuits due to sleet jump. The greater spacing frequently permits a longer span being run. Furthermore, the design of tower is very compact; it has no great length of cross-arm, and its height is at least 20 feet less than that of the equivalent twin circuit tower. The disadvantages lie in the extra cost of right of way and the higher costs of construction. However, where maximum possible reliability is to be secured it is probable that two separate tower lines will in future be adopted. The same practice is adopted upon the highest voltage transmission line at present in operation, that of the

Pacific Light and Power Corporation

This line supplies the city of Los Angeles from the power station at Big Creek, in the Sierra Nevada, 241 miles away.

Fig. 20. One of the semi-anchor towers, equipped with lock insulators, on the Cedars Rapids Manufacturing and Power Company's transmission line.

The present output per circuit at 150,000 volts, 50 cycles, is 35,000 kv.a., but this is far from being the limit of the development. The conductors are of liberal size, being 605,000 c.m. aluminium-seel, strung on 660-foot spans. The standard one-circuit tower weighs 5,600 pounds. The reason for the somewhat heavy construction lies in the large size of the cables and the high elastic limit. Furthermore, it will be seen that a

single circuit tower should be figured to withstand the failure of two cables, or two-thirds of the conductors on one side; at the same time a double circuit tower is figured for just the same eventuality, which in this case amounts to only one-third of the wires on one side. This is the reason for the single-circuit structure always being a little heavier than might appear necessary in comparison with the twin-circuit type.

Tata Hydro-Electric Company

Turning from American to European practice, it is interesting to survey two modern high-tension transmission lines, designed and constructed by an English firm. The first of these is the Tata Hydro-Electric Company, operating be-

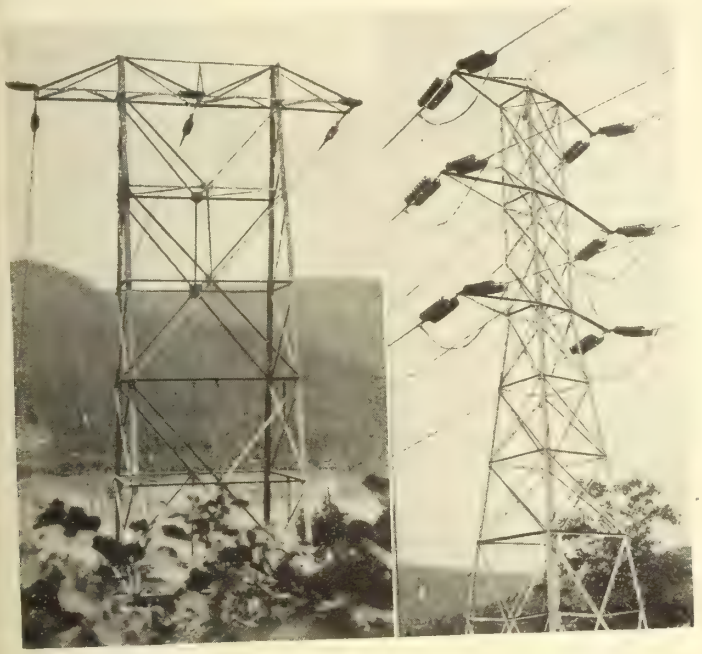

Fig. 21. Heavy river crossing tower, on the Tennessee Power Company. Copper cables strung on Ohio Brass strain insulators.

Fig. 22. Double-circuit anchor tower, on the Tennessee Power transmission line.

tween Khopoli and Bombay, India. Power is generated at a 1,700-foot head in the Western Ghats, and conveyed 43 miles to the city of Bombay, at 100,000 volts, 50 cycles. The voltage has been criticized as being very high for the short distance, but the intention is to extend this system considerably as soon as the load develops. Furthermore, it is believed by some transmission engineers that upon leaving the range of the pin insulator there is no wisdom or economy in operating below the 100 kilovolt figure. The power transmitted per circuit amounts at present to 25,000 kv.a., and the conductors are of seven-strand copper, 121,000 c.m., strung upon spans of 500 feet, with steel towers. The standard tower has a narrow base, but the line is reinforced at intervals with broad base anchor towers. It is interesting to note in comparison with American practice that, instead of being built up with galvanized sections and sherardized bolts, the towers are riveted together on the site and afterwards painted. The standard towers are figured for two conductors failing, and the anchor structures are designed to take care of a failure of all the wires on one side. Loading consists of a wind pressure of 25 pounds per square foot, and the wires are calculated to have a maximum stress of one-fourth the ultimate strength; in other words, the factor of safety is about double that commonly used in America. Several long crossings are encountered, especially on the creeks around Bombay, and the practice is to use a high tensile bronze wire for these spans. Suspension insulators are, of course, used throughout, and are suspended by swing links from the longest cross-arms, so that the unbalanced pull when the wire fails is minimized. This practice would not be possible were the cables not strung well out of the same vertical plane.

Victoria Falls

Another transmission system engineered by the same English firm as the above (Messrs. Bullers, Ltd.) is that of the Victoria Falls and Transvaal Power Company, in South Africa. It links up an extensive group of steam power stations with the Rand mines and other industrial points. Transmission is partly at 40,000 and partly at 80,000 volts. Conductors are of seven-strand copper, 120,000 c.m. in size, there being two double-circuit tower lines for the 80,000 volt transmission. The general design and construction are similar to those of the installation just described, except that the safety factors for towers and cables are five instead of four. In both these examples, it will be noted, there is no necessity to allow for any sleet loading, so the high safety factor does not lead to extremely heavy construction. Every fourth tower is an anchor structure, designed to withstand the failure of all the conductors on one side.

The 80,000-volt transmission extends from Vereeniging to the Rand, 35 miles, and the power transmitted per circuit is 15,000 kv.a. Six-unit suspension insulators are used.

Lauchammer Company, Saxony

The power supply situation in Germany is complicated by the fact that not only are there no easily-developed water-powers in the country, but the coal supply is very poor. During the war these resources have been developed to their utmost, and most of the great nitrate and other electro-chemical works are supplied with steam-generated electric power, transmitted from the mines. Shortly before the war the first undertaking of this kind was put into operation, namely, the system of the Lauchammer Company, Saxony, and it may be assumed that a large number of similar installations of the same kind are now working. The Lauchammer transmission was the first 110,000-volt line in Europe. Power is raised from the low-grade soft coal known as "braunkohl,"

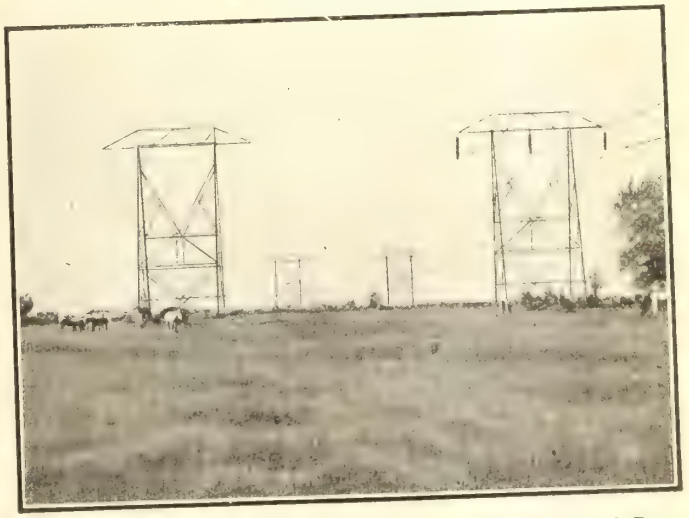

Fig. 23. On the 150-foot right of way of the Pacific Light and Power 150,000-volt lines.

which is consumed at the mine location. To transport this coal it must be compressed into briquettes; it was therefore found to be an economical proceeding to generate electric power and transmit that instead. A double-circuit line conveys the power to Groditz and Riesa a total distance of 34 miles. The voltage is very high in comparison with the length of line, but the reason given by the engineers of the line was that only suspension insulators could be considered, on account of the liability of the pin type to damage due to mischief or other causes. Having adopted suspension units, there was no object in setting a lower voltage than the one chosen. It is, however, more likely that this undertaking was intended as

an experiment, and that the voltage was chosen with a view to systems of much larger extent, such as are now operating.

The frequency is 50 cycles, and about 10,000 kv.a. is carried over each circuit. Wires are of copper, seven strand, 50,000 c.m. in area, strung on narrow base steel double-circuit towers. The standard span is 500 feet, with a long crossing to negotiate the River Elbe of 900 feet. Instead of the usual German practice of using bronze wires for this long span, it was decided to employ copper of 85,000 c.m., strung with a safety factor of five. The spacing between conductors is very short, being only six feet. With this short spacing,

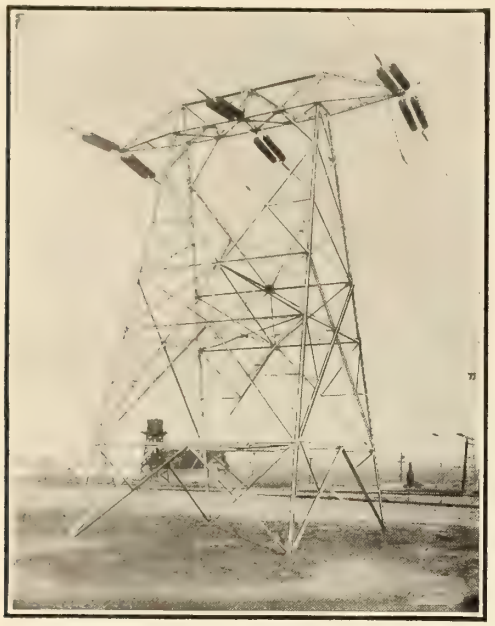

Fig. 24. One of the anchor towers on the lines of the Pacific Light and Power Corporation.

the small wires and the high voltage, it is not surprising that considerable corona losses have been experienced, a factor which was evidently quite overlooked when the lines were designed. As with most European lines, grounding arms are provided on every tower, so that the conductor cannot fail to make contact with one of them if it breaks. Furthermore, conductors are arranged on the equilateral plan, and are transposed six times in the total 35 miles.

Lake Coleridge Development

The Ontario Government is not the only one which has personally supervised and conducted great water-power and transmission developments; similar achievements have been made in New Zealand. The first of the government power undertakings to be put into operation is known as the Lake Coleridge Development. The lake is situated in the Southern Alps of South Island, about 70 miles from Christchurch. About 50,000 kw. is available at this source, but the initial development was for 10,000 kw., which is transmitted by a double-pole line to Christchurch. Another line has also been constructed to the port of Timaru, 100 miles further south. The voltage is 66,000, at 50 cycles.

This is another instance of the construction being modified by special conditions. Owing to the fact that structural steel has all to be imported, a pole line was decided upon for this transmission. Australian ironbark forms a cheap and most durable pole material, and it is employed throughout this system. The voltage used is the highest possible under the limiting features of pole cross-arms and pin insulators; nevertheless, the construction is extremely economical. The two-pole line circuits are carried to their destination by entirely different routes, so that localized lightning disturbances are not likely to affect both circuits. Conductors are aluminium 2/0 B & S, strung with spans of 300 feet, and a spacing of 72 inches.

Inawashiro Hydro-Electric Company

Hydro-electric power is being rapidly developed in Japan, and the most extensive system up to the present is the Inawashiro Hydro-Electric Company. Lake Inawashiro, located 144 miles from Tokio, the commercial capital, provides the reservoir, from which at present 40,000 kv.a. is developed. Transmission is at 115,000 volts, 50 cycles, over a double-circuit steel tower line, the conductors being of copper, seven strand, 200,000 c.m. Whilst it is true that a very large proportion of the electrical plant sold in Japan is of English manufacture, American engineers are responsible for almost every detail of their transmission lines, and the Inawashiro transmission, together with the Katsuragawa and other systems, are very closely in liine with similar installations on this side of the Pacific. There is every indication that the Japanese have gained the experience they required, and they are now rolling structural steel and manufacturing insulators with a view to supplying their own requirements for future transmission line engineering.

Electrical Systems for Automobiles

Summary of Paper Read by Mr. J. M. F. Wilson, B.Sc. before the Manitoba Branch of the Canadian Society of Civil Engineers

Dealing first with ignition systems, the author pointed to the striking fact that over 70 per cent. of the cars turned out in the United States of America in 1916 and 1917 used a battery and coil system of ignition, in a refined and improved condition, but essentially the same as the first cars put on the market. The magneto had for a time superseded the coil and battery, but the development of starting motors and lighting generators, with the resultant ease of keeping a storage battery in good condition, had brought us back to the first-mentioned system. The remaining 30 per cent. could not be passed over lightly, as it included dual, and where extreme reliability was aimed at, double and triple systems. For the most part these systems were luxuries, or relics of a time when the high tension magneto was not yet accepted without suspicion. The paper aimed at dealing with the improvements only in the modern magneto.

Slides were then shown and described, dealing first with a simple battery system for a one-cylinder motor, the difference between three and four terminal high-tension coils and the action of the condenser being explained. Coming next to four and six-cylinder motors, where a timer on the low-tension side was used, it was necessary to have as many coils as cylinders, hence the introduction of the high-tension distributor and single coil.

The Ford was, possibly, the only car using the first method, and it was also the only one using a vibrating coil. With the usual non-vibrating coils it was, of course, necessary to have an interrupter synchronous with the contacts on the H. T. distributor. These were of two types:

(a) The long contact or closed circuit system.

(b) The short contact or open circuit system.

The latter method had to a great extent replaced the closed circuit for one obvious reason, viz., the drain on the battery and resultant economy, although the closed circuit advocates claimed "perfect synchronism" and therefore elimination of mechanical and electrical lag. By "electrical lag" was meant that the spark would not occur in the same position as regards piston travel at different speeds. The "open circuit" had to both close and open the circuit, and therefore the range of time for a possible misfire was longer.

The reason for discarding the vibrating coil was that the latter gave rise to a succession of sparks, the hottest of which usually determined the ignition. Ignition ought to occur with the first spark at the end of the compression stroke, but was generally late.

One favorite type of open-circuit ignition was the Atwater-Kent. Its interrupter was so rapid that the eye could not follow the contact. An actual breaker was shown, with slides illustrating the trigger action. In the one shown the condenser was included with the breaker, but on most systems the condenser was connected directly across the primary coil and included in the coil box.

A study of diagram, Fig. 1, showed how that was possible, since the condenser, usually connected across the interrupter contacts, in this case included also the battery.

The Delco, 1916, was a similar type, but as it did not include a trigger, a resistance unit to limit the current in the primary coil at low speeds was used. In former types, when dry batteries were used as an auxiliary, a relay or vibrator cut down the current. This had now been discarded. The automatic spark advance, which had been also discarded in the very latest types, was a device introduced to overcome the mechanical lag mentioned above. A slide showed the mechanism.

The Westinghouse system showed how the timer or interrupter, the distributor, and the coil could be combined in one unit. The polarity switch, which was intended to reverse the current periodically through the interrupter contacts, prevented the wearing away of the positive contact and the deposit of metal by electrolytic action on the negative contact. The ballast resistance unit was similar to the Delco, the rise in resistance through heating causing the current to remain practically constant in the primary coil at all speeds, and if perchance the circuit remained closed when the car stopped, would materially reduce the drain on the battery if the ignition switch was left in the "on" position.

Sketch of Westinghouse

One example of the long contact or closed-circuit system was the Connecticut. This had a five-terminal coil, because the interrupter contacts and primary circuit were insulated and not grounded, as in the Remy three-terminal coil. The Connecticut had a thermo-static cut-out, which actuated a mechanism to throw out the main circuit-breaker if the ignition switch was left "in" for more than two minutes after the car was stopped. This was merely a double bar of brass and iron heated by a small coil of Nichrome resistance wire. The switch-box was shown.

Magnetos

As regards magnetos there were two systems:

(a) An L.T. magneto, combined with a separate H.T. coil.

(b) An H.T. magneto, a complete ignition unit.

There were two interesting improvements in recent magnetos. First, the Bosch N U 4 (used on the Overland) dispensed with the distributor altogether and used two half-segment insulated slip-rings, each half segment being diametrically opposite, and connected each to one end of the H. T. coil of the magneto instead of grounding one end of the winding, as was usual. There were four brushes, with two spark-plugs in series, so that the spark occurred in two cylinders simultaneously, the extra spark doing no harm, as it took place during the exhaust stroke in one cylinder.

The second innovation was the "rocking field" or the rotation of the magneto so as to make the sparking uniform at all speeds. In an ordnary magneto the most effective spark was obtained only at one position, the armature circuit

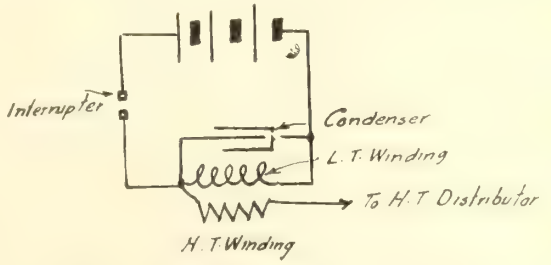

Fig. 1—Condenser connected across primary coil.

being opened when the armature core had just passed beyond the point at which it bridged the pole pieces. When the spark was retarded the opening of the circuit occurred somewhat later, with a wider gap between the iron of the armature core and the pole piece, and consequently produced a weaker spark. Generally magnetos were designed in this way

so that in starting, with the spark retarded, the magneto was working under great disadvantages. Some makers had tried to reverse the order, under the impression that the higher speed in running would compensate for the weaker effect of the armature position, but Taylor, in the Electric Journal for May, 1917, has shown this is a fallacy, as a magneto gives its best effect at 900 r.p.m. and then falls off again with higher speed. If the magnets could be rotated at the same time as the spark lever, to keep the relative postion of armature and pole pieces the same at all speeds, the spark would be the same.

The author then proceeded to describe the Mea and the Dixie as examples of this method. A Dixie magneto was taken to pieces to illustrate the action. The Dixie had other innovations which were ingenious. The contact points on the interrupter admitted of adjustment, while running, and the distributor block on the eight-cylinder set was built in two parallel planes with only four contacts in each, any one contact in one plane being displaced at 135 degrees to a contact in the next plane. This eliminated the difficulty of constructing eight points in one plane. The magneto in this case ran at engine speed, instead of the usual double-speed ratio.

The Bosch two-spark ignition used a double distributor, with an additional spark-plug in each cylinder, arranged directly at the inlet valve with the H. T. winding of the magneto connected to the central point on each distributor. In any motor the object of advancing the spark was to compensate for the slow development of the explosion pressure. Double-pole or two-spark ignition increased enormously the rate of development, with a consequent reduction of the advance necessary. It might be cut down 30 to 50 per cent. Power was gained through avoiding the back pressure at the end of the compression stroke, caused by too much advance in the single-plug method. A retarding effect could be obtained by short-circuiting one set of plugs. To overcome the objection to the weak spark of an ordinary magneto at starting, impulse starters had been introduced. In the Zistram, or K.W. starters, the armature, at slow speeds, rotated in a series of jumps, caused by a fixed notched bar and an extended spring. At high speeds centrifugal action cut out the device.

Electric Starting and Generating Systems

The above were classified into (a) single unit; (b) two unit; (c) three unit types.

In (a) a motor-generator unit charged the battery, operated the lights, and acted as a cranking motor. Sometimes two units in one frame were erroneously classed as a single unit.

In (b) there was a generator for charging and taking care of the lights and ignition, with a separate unit for cranking; while in (c) there was a generator for charging and lighting, a motor for cranking, and a magneto for ignition.

Starting motors were arranged either to drive (1) through the flywheel or (2) through a gearing to the crankshaft. The latter required no starting resistance.

In regard to the voltage at the motor terminals, six-volt systems had several advantages over the twelve-volt. There was greater stability of the lamps filaments, and in certain instances the six-volt battery weighed 35 per cent. less than the twelve-volt for the same capacity in watt-hours. The reason for the greater weight of the twelve-volt is that, starting from a given three-plate cell of one positive and two negatives, doubling the capacity for the same voltage would only require two more plates, with a slightly larger cell, while doubling the voltage would mean another complete cell.

As far as the starting motors were considered, it was easier to design a twelve-volt than a six-volt machine, but their efficiencies and costs were practically identical. The type of battery used for starting was invariably the lead cell, on account of the fact that its only competitor, the Edison battery, while a favorite for lighting, had such a high internal resistance that it could not furnish the necessary starting torque unless it had twice the weight of the lead cell. Quoting from a paper read by Bailey before the A.I.E.E., we find that a 50 amp.-hr. load battery (three cells) weighed 45 pounds, while the same capacity Edison, with four cells, giving nearly the same voltage, weighed only 37 pounds. This Edison battery would be satisfactory as regards lighting, but on occasion the lead cell could provide 135 amperes at 5.2 volts or 702 watts, assuming an internal resistance of .002 ohms per cell. To compete with this a much larger Edison (the A6) would be required, having an internal resistance of .002 ohms. This battery would give 194 amperes, but with a drop of 1.9 volts or a terminal voltage of only 3.62 the watts would be the same as above, viz., 702. Its weight would be 80 pounds, or nearly double that of the lead battery. If the resistance of the motor was .0085 ohms, since the total internal resistance of the Edison is .0096 ohms a current of 310 amperes, as against 415 for the load battery, is all that is available for starting. This would mean that the lead cell would give a 35 per cent. better starting torque.

The various methods of placing the starting motor were then explained. Wherever planetary or double-reduction gearing was used the efficiency of the drive was reduced to 65

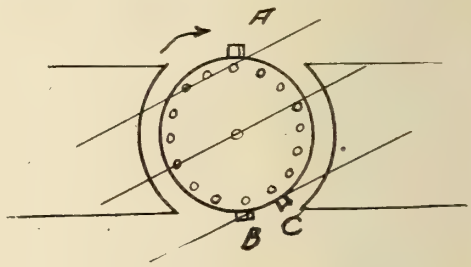

Fig. 2—Generator with three brushes.

per cent. as compared with 90 per cent. for single reduction. Slides were shown of the over-running clutch for cutting out the motor when the engine was driving, and of a favorite form of drive called the Bendix drive.

Generating Systems

Turning finally to generating systems, the author explained the principles involved. It was necessary to have the battery on charge when the car had attained a speed of from seven to ten miles an hour. In order to prevent the lights being burnt out at excessive speed some method of controlling the output was essential. To prevent the battery motoring the generator when the speed dropped below normal the circuit was generally broken by some form of automatic cut-out and cut-in switch.

The methods of regulating were classified as follows:

(a) By field windings on the generator poles (reverse compound).

(b) By electro-magnetic devices controlling the shunt field current (vibrating and other types).

(c) By mechanical governors, keeping the generator speed constant.

(d) By thermal devices (increased ballast resistance).

(e) By third brush excitation of the shunt winding.

The slides showed a Westinghouse system illustrating the first method, the Gray and Davis, and the Bijur, vibrating shunt control, the now discarded Gray and Davis slipping-clutch constant speed system, the old Delco Mercury tube regulator, and the modern Delco third-brush control.

The last method has been adopted recently by so many makers on account of its simplicity that it deserved more than passing attention.

About 1890 Sayers devised a generator with its shunt

field connected between one of the main brushes and a third brush placed a few segments away from the other brush, Fig. 2. If a test were made on any generator, as the load was increased it would be found that a voltmeter would register an increased voltage between one of the main brushes and a certain segment on the commutator, while the voltage would decrease between the other brush and the same segment. Sayers used the first method of connection to keep the voltage of his generator constant, while the second arrangement was the method required to automatically reduce the shunt field current as the speed of a generator on an automobile increased. The effect was due to distortion of the magnetic lines from the main poles as they passed through the armature, by the magnetic field produced at right angles to the main pole field, due to the current in the armature.

In the 1918 Delco set, which was shown to the members, it was interesting to note that the automatic cut-out, the vibrating relay, and even the automatic spark control had been dispensed with, the whole tendency of modern work being to simplify.

The paper was completed with a description of the all-electric Owen car, using the General Electric Tntz transmission system for dispensing with the change-speed gears.

Growth of Montreal Tramways

At a luncheon of the Rotary club of Montreal recently Mr. M. J. Hannaford, assistant engineer of the Montreal Tramways Company gave a very interesting talk on the history of the company and some of the present operating difficulties experienced. The first street car, he said, was used in 1718, although not in Montreal. Strap iron rails were used; then cut stone and lumber substituted. In 1776 the first successful formed rail was laid. To-day rails from 56 pounds per yard to 164 pounds are used in street railway work; in Montreal they use 116 pound rails, 7 inches high. The old Montreal City Passenger Railway Company was formed in May, 1861, starting with 8 cars and six miles of rails. Several extensions were made later, and in 1892 the line was electrified, there being 12½ miles of track. In 1893 there were 94 miles and in 1916 260 miles. Eight hundred and sixty cars are being used at the present time, not including the small ones used during rush hours. Some of the cars are of the p.a.y.e. type.

Referring to the present high cost of maintenance Mr. Hannaford said that the steel alone for a crossing like that at Guy and St. Catherine Streets would cost from $6,000 to $8,000, and labor about the same. Track construction on main streets costs about $42,000 a mile.

Personals

Mr. J. D. Johnston, for five years manager of the B. C. Telephone Company at New Westminster, has been appointed accountant at the Vancouver office.

Mr. R. P. Dryer, assistant sales manager, Canadian Allis-Chalmers, Limited, Toronto, has resigned to take a position in the Pittsburgh office of the Allis-Chalmers Mfg. Company of Milwaukee.

Mr. C. J. Bats, manager of the Hydro-electric Department at Walkerville, has been appointed manager at Leamington, Ont., and is assisting in the change-over from the Edison interests.

Mr. James H. Spicer, formerly chief draftsman and shop superintendent of the bridge department of the Canadian Allis-Chalmers Company, is now works manager for C. W. Hunt Company, Inc., West Brighton, N.Y.

Mr. E. K. Adamson, who has been elected an associate member of the Canadian Society of Civil Engineers, is the resident engineer and superintendent for the Western Power Co. of Canada at Stave Falls, B.C., the maintenance of dams, railway, and general construction being under his charge.

Mr. W. R. Warren, Regina, A.M.I.E.E., has been elected an associate member of the Canadian Society of Civil Engineers. He has had British experience and in 1912 was appointed chief engineer of the department of telephones, province of Saskatchewan, in charge of the construction, maintenance and operation of the system.

Mr. E. C. Adair Hanson, A.M.S.E.E., M.I.M.E., London, the electrical engineer of the city of Saskatoon, has been elected an associate member of the Canadian Society of Civil Engineers. Mr. Hanson, in addition to experience in the Old Country, has held positions with the Canadian General Electric and Montreal Light, Heat and Power Companies.

Mr. Howard Murray, vice-president and for several years manager of the Shawinigan Water & Power Company, has been appointed manager of Aldred & Company, Limited, Montreal, just formed, with a capital of $1,000,000, to carry on the business of investment bankers and fiscal agents. Mr. J. E. Aldred is the president of the Shawinigan Water & Power Company.

Captain R. H. Nichols, who is well known in electrical circles and has been on overseas service with the Canadian Expeditionary Force, returned to Toronto last month for a short time before going to India under the direction of the Imperial Minister of Munitions. Captain Nichols has been appointed general manager of the Bengal Iron & Steel Company, Limited, Kulti (E.I.R.), Bengal, India, a corporation employing 25,000 men.

Mr. E. A. Jacobson, general manager of the Boving Hydraulic & Engineering Co., Ltd., has been elected a member of the Canadian Society of Civil Engineers. Mr. Jacobson studied hydraulic engineering in Sweden, the United States and Germany, and carried out work in the two former countries. He later was appointed chief engineer of Boving & Co. of Canada, Ltd., and in 1915 assumed his present position with the Boving Hydraulic & Engineering Co., successors to Boving & Co.

Obituary

Many friends throughout the Dominion will have learned with regret of the death, in France, of Michael Chapman, formerly of Chapman & Walker, Toronto, and previous to that with the Canada Foundry Company. Mr. Chapman took the officers' training course in 1915 with the Royal Grenadiers, and later obtained a commission with the Grenadier Guards in England. He leaves a widow and a young son and daughter.

Mr. Alfred R. Miller, treasurer of the Canadian Westinghouse Company, Limited, died on Sunday, April 28th, 1918, at Hamilton, Ont., aged 43 years. Mr. Miller was born in England, and removed to Canada with his parents at an early age. His whole business life was virtually spent with the Westinghouse interests in Canada, having entered their employment in his young manhood, about twenty years ago, and by his ability, industry and close application to business, progressed with the company until at the time of his death he occupied the responsible position of treasurer. Mr. Miller endeared himself to a host of friends by his kindly disposition and thoughtfulness for others.

The Ferranti Electrical Company of Canada, Limited, announce a change in address of their Montreal office from 704 Unity Building to Room 101, Southam Building, 128 Bleury Street.

The Dealer and Contractor

Costs and Accounting for the Electrical Contractor—Co-operation of Manufacturers and Wholesalers Needed—He the Poor Credit Risks

At a time when the Toronto Electrical Contractors' Association is wrestling with the problem of establishing a uniform system of accounting, our members will be encouraged to know that the National Electrical Contractors' Association are wrestling with the same problem, equally siezed of its importance and equally determined on a solution. At the recent meeting in Detroit, which by the way was attended by our president, Mr. K. A. MacIntyre, Mr. J. E. Sweeney, Chairman of the National Committee on Costs and Accounting, after a thorough study of the subject, made the following report. Mr. Sweeney outlined the work of the Credit and Accounting Committee as follows:

> To collect information on improved bookkeeping systems and methods of cost accounting, overhead, etc.; to improve the credit of members; to obtain information as to the credit of customers of members and to furnish information as to the best ways of collecting accounts, etc.; to confer with National Electrical Credit Association and other credit associations.
>
> The work of this committee, as I see it, is divided into four parts, as follows:
>
> First, collecting information regarding a suitable bookkeeping system and getting this information into form to submit to our members with the recommendation that they use it.
>
> Second, collecting information and data on Cost Accounting and Overhead Expenses to be submitted to our members for their guidance in conducting their business.
>
> Third, to study the problem of improving the credit ratings of our members and to furnish information as to the best methods of collecting accounts due them.
>
> Fourth, to obtain information as to the credit of customers of members

On these various topics Mr. Sweeney made the following remarks, as reported in the Electrical Contractor-Dealer:

In connection with the first item, the bookkeeping system. It is my idea that this should conform as nearly as possible to standard accounting practice, and if this is adhered to the system can be submitted to any contractor, regardless of the size of his business, for his use, and it should place him in a position to draw off a statement of his assets and liabilities that can be presented to his banker or wholesaler in an intelligent manner. In connection with this bookkeeping system there should be a standard classification of accounts for the use of the contractor and dealer. This should not only include the capital accounts appearing in the statement of assets and liabilities, but should include accounts covering expense items that go to make up the overhead, or cost of doing business. I have prepared a statement of assets and liabilities, also a list of expense items which is shown herewith. These have been presented at the various district meetings of our State Association, at which were present jobbers and central-station men, as well as the contractors. During these meetings much discussion has been produced regarding the relation of one account to another, and how a good or bad condition may be shown by the statements; also how a general analysis of the running of the business can be obtained from a comparison of the accounts shown in the statement. All of this pertains to the bookkeeping system or accounting, but is very closely allied to the general question of credit.

Collection of Cost Accounting and Overhead Expense Information

In regard to the second division of work, the Collecting of Information and Data on Cost Accounting and Overhead Expense. The statement of these items, which is itemized here, shows the general expense items that compose the cost of doing business. If it were possible to get all of the contractors to designate their expense items in the same manner, and by the same name, in a short time we would be able to collect very valuable information regarding the relation of various expense items to the amount of business done, and it would be possible to take any concrete example and work out with a fair degree of accuracy whether the business in question had a fair chance to succeed, and, if not, it could be determined just where the fault lay and steps could be taken to have the trouble corrected. We should have these expense items worked out on a percentage basis against different classes and different volumes of business.

Improvement of Credit Rating

Third: Regarding the problem of improving the credit ratings of the members and to furnish them with information as to the best methods of collecting accounts. This is a pretty large subject, and the best method of procedure must be determined after consulting with the National Electrical Credit Association, the jobbers, manufacturers, and others interested, as well as the members of our own executive committee. The fundamentals of a credit risk are character, capacity and capital, which means that the members should be of good general and moral character, and have such other qualifications as are required to be known as a man of good character; and next, that they should have capacity of ability to understand running their business in a business-like way; and right here, in addition to technical ability, could be included that they should have a uniform system of accounting, maintain a good cost system, and have such other up-to-date business methods as are required in other lines of successful business.

And finally, in the matter of capital I believe that, gen-

rally speaking, the contractor is almost invariably short of unds in his business. We should so build up the qualities f character and capacity that it will be easier for him to ecure additional capital to extend his business, or handle is present business without embarrassment or without asking or unwarranted favors from his wholesaler or banker.

Determination of Credit of Customer

Fourth, regarding the matter of obtaining information s to the credit of customers of members. It seems to me hat there is very little that can be done by our Association in this regard as far as local information is concerned.

In general, it seems as though it should be possible to adopt a system of bookkeeping and accounts and publish a booklet covering the subject in detail, which could be distributed to members. I think we could be reimbursed by the cost of the book by charging a dollar a copy, or whatever was necessary to defray the expense, and it would be my recommendation that we co-operate with the Electrical Credit Association, the Society for Electrical Development, the Jobbers' Association, and any others who may be interested, with that end in view of finally making a summary of the information and data collected, to be distributed at the lowest possible cost. This book would, of course, cover the general information regarding a suitable bookkeeping system, but would leave the selection of the different types of books to use to accomplish the results to the individual judgment. It would also cover the matter of Cost Accounting and itemize the items that go to make up "overhead," and give the correct method of figuring the overhead costs.

In regard to the matter of credit, it seems to me as though this will eventually take care of itself as we get better and more accurate bookkeeping and cost-accounting systems; but we must have the co-operation of the manufacturers and wholesalers in the building up of the credit of our members. Probably our greatest trouble right now is caused by these branches of the industry going out and selling to so-called contractors who are not worthy of credit, who never have been worthy of credit and at the time the sale was made had no indication of having the proper requisites, namely, character, capacity and capital, which would entitle them to credit. When the loss comes, as it must when credit is granted on this basis, the jobber and manufacturer set up the complaint that the contracting business is a hazardous business, and that all contractors are poor credit risks, whereas their particular trouble is with themselves rather than with the contractor. Their credit men and their salesmen should be educated as well as the contractor. They should confine their selling efforts to establishing electrical contractors of sound credit rating, and this will do as much, or more, good to establish the credit of our business as any one thing that I know of.

A "Convenience Outlet" Campaign

The Society for Electrical Development have decided to conduct a "Convenience Outlet" campaign to be carried out along lines similar to the "Wire Your Home" and "Electrical Christmas" campaigns. The Society will issue attractive booklets, folders and lithograph posters and will endeavor to procure the co-operation of the entire industry in educating the public to an appreciation of the convenience of additional outlets, preferably on a separate circuit to the lighting system. With the scarcity of servants and the general plentiful supply of money it is felt that the time is opportune to induce the people to add to the comfort of their homes in this way, at the same time assisting in the conservation of coal.

The thirty-fourth annual meeting of the National Electric Light Association, and its forty-first convention, will be held at the Hotel Traymore, Atlantic City, on June 13-14. All business will be devoted to problems arising out of the war.

Irving Smith, Electrical Apparatus and Specialties, Montreal, P.Q., announces his change of address to 602 New Birks Building, 10 Cathcart Street. He was formerly at 809 Unity Building.

Trade Publications

C.G.E. Publications—Bulletin No. 48025, describing electricity in logging and sawmills; chart describing C.G.E. round pattern curve drawing instruments, both a.c. and d.c., and bulletin No. 42552A describing motor generator sets. All bulletins illustrated.

The Ohio Brass Company, Mansfield, Ohio, have issued supplement No. 1, containing additions and improvements in O.B. materials for electric railways, mine haulage and Hi-Tension porcelain insulators. This supplement is to be used in conjunction with general catalog No. 16.

Rheostats—Circular No. 502, by the Ward-Leonard Electric Company, describing current regulating rheostats for 32 volt lighting plants and for 20 ampere moving picture lamps. The same company have also just issued a price and data book on armature speed controllers and a leaflet on small circuit breakers.

Crocker-Wheeler—Bulletin No. 183, describing motor drive for printing machinery; bulletin No. 184, direct-current lighting and power generators, direct connected and engine types, 25 to 3750 kilowatts, and bulletin No. 185, coupled and belt types of alternating current generators, two and three phase, 50 kv.a. and up. All bulletins well illustrated.

Code of Lighting for School Rooms

Revised Edition Jus Issued by the Illuminating Engineering Society—Of Extreme Importance to the Future Well-being of the Race

The Illuminating Engineering Society recently announced that the revised edition of the code of lighting for school buildings would be published in the near future and this edition is now in type. Copies of the code may be obtained at nominal cost from the New York offices of the society.

From time to time we have printed extracts from this code as variations have been made, feeling that the importance of the subject justified all the publicity it could be given. Following this policy we are printing below copious extracts from the revised code and urge that engineers bring the important matters contained therein as forcibly as possible to the attention of school boards everywhere. The importance of conserving the sight of our school children cannot be overestimated and the cost of proper lighting to-day is very much less than the average school trustee imagines. The latest types of lamp have gone a long way towards making ideal school lighting a possibility at small cost.

CODE OF LIGHTING SCHOOL BUILDINGS

Article I. General Requirements.—When in use, all buildings should be provided, during those hours when daylight is inadequate, with artificial light according to the following Articles.

Buildings hereafter constructed should be so designed that the daylight in the work space is reasonably uniform and the darkest part of any work space is adequately illuminated under normal exterior daylight conditions:[2]

Article II. Intensity of Artificial Illumination.—The desirable illumination to be provided and the minimum to be maintained are given in the following table:[2]

Desirable and Minimum Illumination

	Artificial lighting Foot-candles (Lumens per Square foot)* at the work	
	Minimum	Ordinary Practice†
Storage spaces	0.25	0.5- 1.0
Stairways, corridors	0.5	1.0- 2.5
Gymnasium	1.0	2.0- 5.0
Rough shop work	1.25	2.0- 4.0
Auditoriums, assembly rooms	1.5	2.5- 4.0
Class rooms, study rooms, libraries, laboratories, blackboards	3.0	3.5- 6.0
Fine shop work	3.5	4.0- 8.0
Sewing, drafting rooms	5.0	6.0-12.0

Article III. Shading of Lamps.—Lamps should be suitably shaded to minimize glare. Glare, either from lamps or from unduly bright reflecting surfaces, produces eye-strain.

Article IV. Distribution of Light on the Work.—Lamps should be so arranged as to secure a good distribution of light on the work, avoiding objectionable shadows and sharp contrasts of intensities.

Article V. Color and Finish of Interior.—Walls should have a moderate reflection factor; the preferred colors are light gray, light buff, dark cream and light olive green. Ceilings and friezes should have a high reflection factor; the preferred colors are white and light cream. Walls, desktops and other woodwork should have a dull finish.

Article VI. Switching and Controlling Apparatus.—Basements, stairways, store rooms, and other parts of the building where required, should have switches or controlling apparatus at point of entrance.

Article VII. Emergency Lighting.—Emergency lighting should be provided at main stairways and exits to insure reliable operation when, through accident or other cause, the regular lighting is extinguished.

Article VIII. Inspection and Maintenance.—All parts of the lighting system should be properly maintained to prevent deterioration due to dirt accumulation, burned-out lamps and other causes. To insure proper maintenance, frequent inspection should be made at regular intervals.

DAYLIGHT

Intensity of Daylight.—In general, the minimum intensities of daylight illumination should be considerably greater than those provided in artificial lighting, owing to the adaptation of the eye to a much higher level of illumination (brightness) in the daytime.

Direction of Light.—One of the fundamental rules for proper lighting of desks is to have the preponderance of light come from the left side. For this reason many school authorities advocate unilateral lighting, that is, lighting by windows located on one side of the room only, especially for class rooms. This method of lighting is recommended where the rooms do not exceed about 24 feet (7.9 m.) in width, with windows about 12 ft. (3.9 m.) high. If the rooms are much wider than this, bilateral lighting, that is, lighting by windows located on two sides of the room, may be required in order to provide sufficient illumination in every part of the room and at the same time to prevent too great a diversity of contrast in the intensity of light on the work spaces.

To secure the highest lighting value it is recommended that the room be so designed that no working location is more distant from a window than one and one-half times the height of the top of the window from the floor.

Windows at the left and rear where practicable are preferable to those on the left and right sides of the room, because of cross shadows created by the latter arrangement. Lighting by overhead sources of natural illumination although sometimes used for assembly rooms, auditoriums and libraries, with relatively high ceilings, has ordinarily little application in class rooms and has found little favor in practice.

The sky as seen through a window is a source of glare. For this reason the seating arrangements should always be such that the occupants (pupils) of the room do not face the windows.

Window Openings.—Tests of daylight in well lighted school buildings indicate that, in general, the glass area does not fall below 20 per cent. of the floor area.

As the upper part of the window is more effective in lighting the interior than the lower part, it is recommended that the windows extend as close to the ceiling as practicable.

Lighting Value of a Window.—The lighting value of a window at any given location in the room, will depend upon

*It should be borne in mind that intensity of illumination is only one of the factors on which good seeing depends.

†Under the column headed "Ordinary practice," the upper portion of the range of intensities is preferable to the lower; where economy does not prohibit, even higher intensities than those cited are often desirable.

‡Daylight illumination values should be at least twice the values given in the Table, Article II, for artificial lighting.

[2]The illumination intensity should be measured on the important plane which may be the desk-top, blackboard, etc.

The method of computing the flux of light (lumens) required to do any desired illumination is described under the heading "Design of Lighting Installation."

For more specific information regarding the lighting of shops, see "Code of Lighting Factories, Mill and Other Work Places," issued by the Illuminating Engineering Society.

the brightness of the sky, the amount of sky visible through the window at the given location in the room, and indirectly upon the reflection factor of the surroundings and the dimensions of the room.

Observations in well lighted school rooms having a comparatively unobstructed horizon, show that under normal conditions of daylight, satisfactory illumination is usually obtained when the visible sky subtends a minimum vertical angle of 5 degs. at any work point of the room.

In cases in which the horizon is obstructed, as by adjacent high buildings or by trees, provision should be made for a larger window area than would otherwise be required; also if need be, for redirecting the light into the room by means of prismatic glass in the upper sashes of the windows, or by prismed canopies outside of the windows.

Window Shades.—Although direct sunlight is desirable in interiors from a hygienic standpoint, it is often necessary to exclude or diffuse it by means of shades. These shades should perform several functions, namely, the diffusion of direct sunlight, the control of illumination to secure reasonable uniformity, the elimination of glare from the visible sky and the elimination of glare from the blackboards wherever possible. These requirements make it desirable to equip each window, especially in class rooms, with two shades operated by double rollers placed near the level of the meeting rail. The window shades may thus be raised or lowered from the middle, which provides the maximum elasticity for shading and diffusing the light. The shades should be preferably of yellow-colored material that is sufficiently translucent to transmit a considerable percentage of the light while at the same time diffusing it. This method of installation permits of lowering the window from the top or raising it from the bottom without interference with the shades.

A more complete control of the light from the walls of courts is very helpful in increasing interior illumination. Hence the walls of courts should have high reflection factors. Dark colors should be avoided.

Maintenance—Windows and overhead sources of natural light (so-called skylights) should be washed at frequent intervals and surfaces such as ceilings and walls should be cleaned and refinished sufficiently often to insure their efficiency as reflecting surfaces. It should be borne in mind that the maintenance of adequate daylight indoors is also dependent upon various external factors, such as the future erection of buildings and the growth of trees or vines.

ARTIFICIAL LIGHT

Systems of Lighting.—It is customary to divide the systems of artificial lighting into three classes, namely, direct, semi-indirect and indirect. This division is arbitrary and the boundary lines are quite indefinite.

A direct lighting system is known as one in which most of the light reaches the work plane directly from the lighting unit including the accessory which may be an opaque or glass reflector or a totally enclosing transparent or translucent envelope Direct lighting systems may be further classified as localized and general or distributing. In the former the units are so placed as to light local work spaces, and in the latter they are well distributed so as to light the whole area more or less uniformly.

A semi-indirect system is known as one in which a portion of the light reaches the work plane directly from the unit and a relatively large portion reaches the work plane indirectly, by reflection from the ceiling and walls. The accessory is usually an inverted diffusing bowl or glass reflector. When this glass has a high transmission factor the lighting effect approaches that of ordinary direct lighting, and when of low transmission, the effect approaches that of indirect lighting.

An indirect system is known as one in which all or practically all the light reaches the work plane indirectly after reflection from the ceiling and walls. The accessory is usually an opaque or slightly translucent inverted bowl or shade containing a reflecting medium.

All three of these systems of lighting are in successful use in schools. There has been a growing preference for semi-indirect and indirect lighting, especially since the introduction of modern lamps of great brilliancy. Local lighting by lamps placed close to the work is unsatisfactory except for special cases such as the lighting of blackboards, maps, charts, etc.

Shading of Lamps.—Except in very rare instances bare light sources should not be exposed to view. They should always be adequately shaded or completely hidden. Even when shaded by translucent media, such as dense glassware, the lighting units should be placed well out of the ordinary range of vision; in other words, it is recommended that lighting units be of low brightness,[3] even if they are located high in the field of view.

The maximum brightness contrast of juxtaposed surfaces in the normal visual field should be preferably not greater than 20 to 1; that is to say, the darkest part of the work space observed should have a brightness preferably not less than one-twentieth of that of the brightest part.

Glossy Surfaces and Eye-Strain.—Glossy surfaces of paper, woodwork, desk-tops, walls and blackboards are likely to cause eye-strain because of specular or mirror-like reflection of images of light sources, especially when artificial light is used. Matte or dull finished surfaces are recommended. It is to be noted that a high reflection factor does not necessarily imply a polished or glazed surface.

To minimize eye-strain it is recommended that unglazed paper and large plain type be used in school books.

Children should be taught to hold their books properly, to assume a correct position relative to the light source, and to safeguard their vision.

Color of Light.—It has been found in practice that the admixture of daylight and artificial light is not satisfactory unless the latter is derived from lamps designed with special reference to producing daylight color values. Hence in waning daylight it is desirable to shut out the daylight and to use artificial light exclusively unless the lamps are of the type mentioned.

Design of Lighting Installation.—The illumination intensity on the horizontal work plane should be as uniform as

---

[3]Preferably not to exceed 250 millilamberts. A millilambert is equal to the brightness of a perfectly reflecting and diffusing surface illuminated to an intensity of 0.929 foot-candle, (0929 lumen per square foot). It is also equal to 0.002 candle per square inch.

The following table shows the order of magnitude of the brightness of some light sources in common use:

	Approximate brightness	
	Millilamberts	Candles per sq. in.
Indirect lighting: ceiling, directly above the lighting unit	5. to 75.	0.01 to 0.15
Semi-indirect lighting: heavy density glassware	35. to 100.	0.07 to 0.2
Semi-indirect lighting: light density glassware	200. to 1,000	0.4 to 2.0
Direct lighting: 10 in. (25 cm.) opal glass ball containing 100-watt vacuum tungsten lamp at center	250. to 500.	0.5 to 1.0
Direct lighting: vacuum tungsten lamp, (frosted) in open bottom reflector	2,000. to 3,000.	4. to 6.
Vacuum tungsten lamp, filament exposed to view	500,000.	1,000
Gas-filled tungsten lamp, filament exposed to view	2,000,000.	4,000
Gas-mantle, bare	15,000.	30
Gas-mantle, concealed in 6 in. (15 cm.) opal glass globe	1,000.	2
Mercury arc tube (glass)	8,000.	16
Daylight: clear blue sky	1,000.	2.

[4]This ratio refers to the light received by the object illuminated and should not be confused with the ratio of 20 to 1 for brightness contrast previously given, which refers to the light radiated by the object. For example, a blackboard and a white sheet of paper on it may receive the same amount of light, but the latter will reflect much more light than the former, thus causing a marked brightness contrast between the two surfaces.

possible. The variation should not be greater than 4 to 1.[4]

The chief factors which must be considered in arriving at the size and number of lamps to be used in a given room are (1) the floor area; (2) the total luminous flux[5] emitted per lamp, and (3) coefficient of utilization of the particular system considered. The first should be measured in square feet. The second may be obtained from a data book supplied by the manufacturers of lamps. The third involves many factors such as the relative dimensions of the room, the reflection factor of the surroundings, the number of lighting units and their mounting height, and the system of lighting. By coefficient of utilization is meant the proportion of the total light flux emitted by the lamps which is effective on the work plane. In the accompanying table approximate coefficients of utilization for modern lighting equipment are given. The work plane in this case is a horizontal plane 30 inches (76 cm.) above the floor. These values refer to the initial installation without any allowance for depreciation.

Approximate Coefficients of Utilization—Modern Lighting Equipment

	Light color walls Light color ceiling	Medium color walls Light color ceiling
Small Rooms (Offices, Corridors etc.)		
Direct lighting; dense glass (open bottom reflectors)	0.40	0.35
Semi-indirect lighting; dense glass	0.25	0.22
Indirect lighting	0.23	0.20
Medium Sized Rooms (Class Rooms, Laboratories, etc.)		
Direct lighting; dense glass (open bottom reflectors)	0.50	0.45
Semi-indirect lighting; dense glass	0.35	0.30
Indirect lighting	0.30	0.25
Large Rooms (Auditoriums, etc.)		
Direct lighting; dense glass (open bottom reflectors)	0.62	0.60
Semi-indirect lighting; dense glass	0.43	0.40
Indirect lighting	0.40	0.38

For determining approximately the size and number of lamps to be used in a given room by means of the coefficients of utilization given in the preceding table, it is necessary to know the luminous output in lumens per watt for the electric lamps considered or in lumens per cubic foot of gas consumed per hour if gas lamps are considered. At the present time (1917) the light output of tungsten filament electric incandescent lamps, based on average service conditions of regularly maintained installations, ranges from 8 lumens per watt for the smaller vacuum tungsten lamps to 14 lumens per watt for the larger gas-filled tungsten lamps employed in school lighting. For incandescent gas systems similar service values range from 150 to 250 lumens per cubic foot of artificial gas consumed per hour. The computation for the total lumens required to give a certain illumination intensity in foot-candles is as follows:

N = number of lamps.
L = lumens output per lamp.
E = coefficient of utilization.
A = area of floor or horizontal work plane in square feet.
I = illumination intensity in foot-candles.

$$\frac{N \times L \times E}{A} = I$$

that is, the number of lamps multiplied by the output per lamp in lumens, multiplied by the coefficient of utilization, divided by the area of the horizontal work plane in square feet, gives the illumination intensity in foot-candles.

If the size of the lamps is to be ascertained the computation is made thus:

$$L = \frac{I \times A}{N \times E}$$

To illustrate by an example, assume a room, whose floor (also work plane) is 30 ft. by 18 ft. (9.1 by 5.5 m.), to be lighted by a semi-indirect system from six fixtures containing one lamp each. It will also be assumed that the ceiling is highly reflecting, the walls moderately reflecting, and the illumination intensity desired is 5 foot-candles. The luminous output required of each of the six lamps will be found by substituting the assumed values in the equation, thus:

$$L = \frac{5 \times 30 \times 18}{6 \times 0.30} = 1{,}500 \text{ lumens}$$

Allowing a depreciation factor of 20 per cent. as representing a well maintained installation, the lumens actually required would be 1,500/0.8 = 1,875 lumens. If gas-filled tungsten lamps are considered, whose average output under service conditions is 12 lumens per watt, it is seen that a 150-watt lamp in each fixture will give the desired results.

If gas mantle lamps are considered, whose average output in lumens under service conditions is 250 lumens per cubic foot of gas consumed per hour, it is seen that a lamp consuming 5 cubic feet of artificial gas per hour will be satisfactory in each fixture.

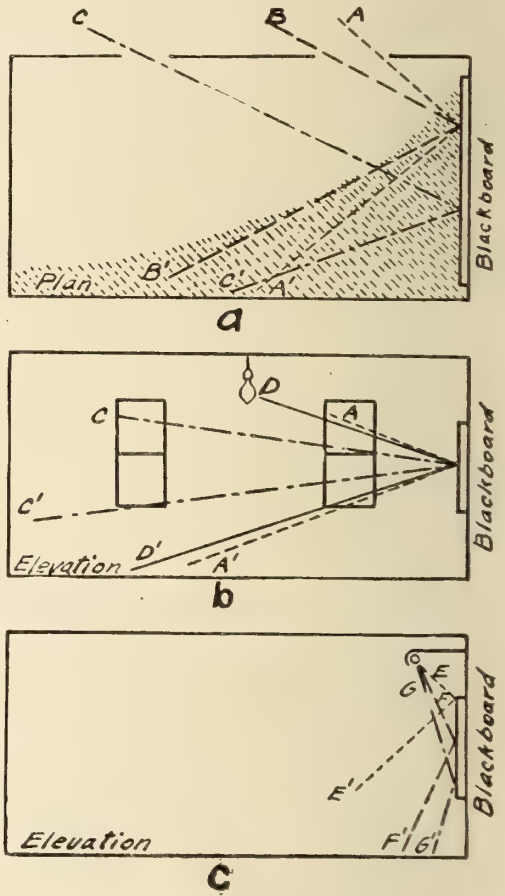

Fig. 1—Diagrammatic illustration of glare from blackboards.
(a) Showing the occupants of seats in shaded area are subjected to daylight glare from blackboards.
(b) Showing angles at which glare is experienced from daylight and from artificial light.
(c) Arrangement of local artificial lighting to minimize glare.

The above example is intended solely to illustrate the method of computation. Estimates of the illumination intensity obtained from an actual installation may also be made by a similar computation.

Suitable switching and controlling arrangements should be made to permit of lighting one or more lamps independently as conditions may require.

The teacher's desk may be illuminated by one of the overhead lighting units, or if necessary, by a desk lamp.

With the usual lighting equipments the distance between the units should not exceed one and one-half times the

[5]The flux is measured in lumens. A lumen is the unit of light flux and is the quantity of light required to illuminate 1 square foot of area to an average intensity of 1 foot-candle.

height of the apparent source of illumination above the working level.

Blackboards.—Blackboards should be of minimum size practicable and should not be placed between windows. Their position should be carefully determined so as to eliminate the glare due to specular reflection of images of either artificial or natural light sources directly into the eyes of occupants of the room. The surface of blackboards should be as dull as possible and this dullness should be maintained.

In order to avoid excessive brightness contrast which is trying to the eyes, blackboards should not be placed on a white or highly reflecting wall.

Rehabilitating the Lighting of Old Buildings.—This will be illustrated by an actual case where the artificial lighting of a class room was made satisfactory at a small expense. In Fig. 2 (a) is shown an elevation of a section of the class room showing the old fixtures. In Fig. 2 the circles containing crosses × indicate the positions of the two old fixtures in this room. The chief objections to this old system were as follows:

(1) The lighting units were hung too low, so that eye-fatigue resulted from the bright sources in the visual field.

(2) The light sources were not shielded from the pupils' eyes.

(3) Two fixtures are insufficient to provide satisfactory illumination over the entire work plane in a room of the dimensions shown. This unsatisfactory condition was remedied by means of six fixtures placed as indicated by the circles.

These fixtures consisted of inverted diffusing glass shades containing one lamp each. The dimensions of the room are shown in the illustration.

Maintenance.—A systematic maintenance should be provided in order to insure against depreciation in the illumination intensity due to burned-out lamps, broken gas mantles, discoloration, etc., and to accumulations of dirt upon the lamps, and upon the surfaces of the reflecting and transmitting media. It is found in practice that carelessness in this respect may easily reduce the effective illumination by 50 per cent., especially in indirect and semi-indirect lighting.

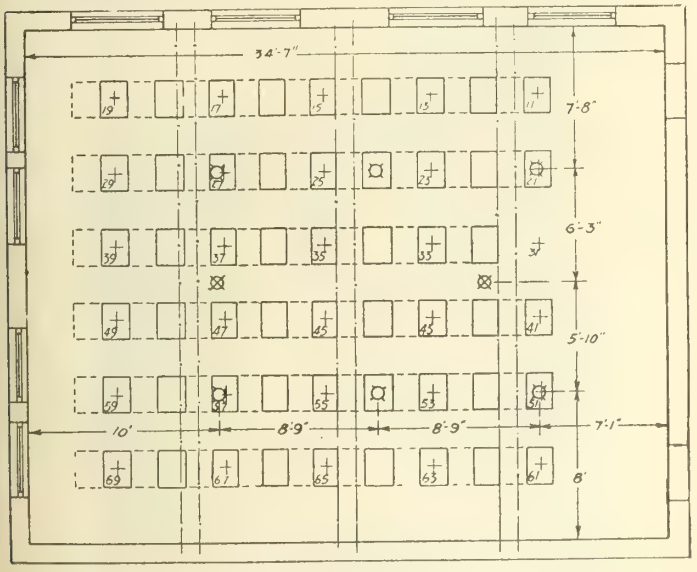

Fig. 2—Two crossed circles represent old lighting, plain circles new outlets for artificial lighting of school room.

Glare, due to specular reflection from blackboards, may be reduced or eliminated by lighting them by means of properly placed and well shaded local artificial light sources.

In Fig. 1 are shown some simple graphical considerations of blackboard lighting. In (a) is shown a plan view of a room with windows on one side. Rays of light are indicated by A, B and C in a horizontal projection. These are supposed to come from bright sky. By the application of the simple optical law of reflection—the angle of incidence is equal to the angle of reflection—it is seen that pupils seated in the shaded area will experience glare from the blackboards on the front wall. In (b) is shown the vertical projection of the foregoing condition. It will be apparent from this graphical illustration that by tilting the blackboard away from the wall at the top edge, the pupils in the back part of the room will be freed from the present glaring condition. Whether or not this tilting will remedy bad conditions may be readily determined in a given case. In (b) the effect of specular reflection of the image of an artificial light source is shown by D. In (c) is shown a proper method of lighting blackboards by means of artificial lighting units. This will often remedy bad daylight conditions whether due to an insufficient illumination intensity of daylight or due to reflected images of a patch of sky.

Fred Thomson Company in New Quarters

The firm of Fred Thomson Company, Limited, manufacturing and contracting electrical engineers, Montreal, have removed from 326-328-330 West Craig Street, to their own new building at 7-13 St. Genevieve Street, a couple of short blocks west of their old location.

This company makes a specialty of electrical repairs of all kinds—from fan motors to the largest electrical units in use in Canada. They also manufacture induction motors up to 25 h.p. capacity and expect in their new establishment to enlarge their already considerable business in this connection They design and build special apparatus of all kinds, transformers, magnetic apparatus, coils, etc., for special purposes They buy, sell and exchange new and second-hand electric motors, generators, etc., a feature of their business being a positive guarantee with any second-hand machine that has gone through their repairing and testing departments.

In their new building, which is of fireproof mill construction and consists of three floors and a basement, and which was designed by Mr. Jas. H. Hunter, of Montreal, to meet their special requirements, they have a total floor space of over 30,000 square feet.

The various floors, which have light on three sides, are arranged to accommodate the different departments.

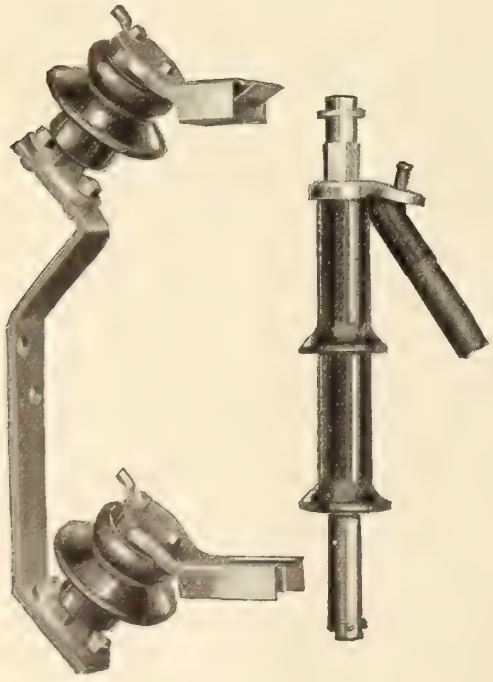
On the top, or third floor, there are the draughting and designing room, the storeroom, the pattern shop, the transformer department, and the coil making department.

On the second floor, at the front of the building, there are the general office and the two private offices for the officers of the company, and at the rear of these offices the main winding, repairing and testing departments, where the general work of repairing, winding, assembling and testing is carried on. Special reference should be made to the impregnating and baking department, where on a concrete floor are the dipping and impregnating tanks and the electrically heated bake ovens and an overhead travelling crane which handles all motors, motor parts, heavy coils, etc., between the tanks and the ovens. The testing department, switchboard and accessories are equipped for testing at all voltages and at any of the frequencies desired on alternating current and at any required voltage on direct current.

On the first, or ground floor, there are the receiving and shipping room, the showroom where all new and ready-for-sale second-hand machinery is kept, a department where all heavy work of winding, assembling and testing is done and an up-to-date machine shop.

In the basement, which contains the heating apparatus, and which is used principally for storage of second-hand machinery, castings for motors, pulleys, heavy hardware, etc.,

the cutting and punching of the discs for the stators and rotors of their induction motors is carried on.



The building is fully equipped throughout with travelling cranes for handling conveniently and with a minimum of labor all apparatus which they are called upon to build or repair, a freight elevator operates between the basement and the top floor, and there are adequate wash rooms and toilet arrangements for the employees; altogether it is in every way an up to date manufacturing establishment.

This company is one of the oldest and best known in the electrical industry throughout the Dominion. The firm was founded by Mr. Fred Thomson, one of the pioneers in the electrical line, who came to Montreal in 1882, and who, after eleven years as chief electrician of the old "Royal" Electric Company, started in business on his own account in a small way in 1894 in a small office in the old Temple Building, on St. James Street. The business grew, and after two or three changes of location, each time to larger premises, they moved to Craig Street in 1899, where they had been established up to the time of their recent removal to St. Genevieve Street.

The officers of the company, which was incorporated as a joint stock company in 1913, are: Fred Thomson, president and general manager; Clarence Thomson, vice-president and secretary-treasurer; H. A. McPhee, superintendent; A. Walker, electrical engineer, and J. B. Lacroix, electrical engineer.

Combined Fuse and Outdoor Disconnecting Switch

In connection with the operation of small outdoor substations the combined fuse and disconnecting switch here shown is used primarily for the protection of transformer banks where no primary switches are required. The fuse is suitable for opening the exciting current of transformer banks not exceeding 300 kv.a. Secondary switches should be provided so that the load can be removed in case it should become necessary to open the primary side with the fuses.

The fuse holder is removed by a fuse hook from the ground. To open the circuit the holder is lifted completely out of the contacts by the fuse hook which is so constructed that the fuse holder will hang vertically when held by the hook. Then if desired, the upper end of the fuse holder is inserted in and hangs from the cap, which partly surrounds the lower contact clips. To close the circuit, the upper contact of the holder is placed in the upper clips by the operating hook and then the lower contact is pressed by the hook into the lower clips. The supporting insulators are of the petticoat type.

The fuse holder has petticoats so spaced as to provide ample creepage surface. The contact parts, at the ends of the fuse holder are of brass and when the holder is in normal operating or closed position engage with the stationary contacts on the supporting insulators. The contacts are protected against the effects of ice, sleet and snow, by the method of mounting and by means of a punched hood attached to the top of each supporting insulator. The fuse passes through the centre of a treated fibre tube within the porcelain fuse holder and is attached to the upper or closed end of the fuse holder by means of an adjustable clamp, and to the lower or open end of the fuse holder by a circular ring, which when tightened, holds the fuse firmly in place without a tendency to shear off. When the fuse blows, the explosion consequent upon the expansion of the gases formed, effectively expels the arc through the open end of the holder downward and instantaneously opens the circuit. New fuses may be inserted readily.

This combined fuse and disconnecting switch, made by the Canadian General Electric Company, and known as the type TD-127, is made in single-pole units for vertical mounting on flat surfaces. It can be obtained for use at 15,000, 22,000, 35,000 and 45,000 volts. The maximum current rating is 50 amperes. No special arrangements are needed for mounting; the supporting bracket is bolted to the cross arm.

A New Type of Safety Switchboard

A novel type of switchboard, known as the Krantz Auto-Lock switchboard, has been placed on the market by the Krantz Manufacturing Company, of Brooklyn. This line of boards has two distinctive features: (1) unit construction, and (2) absolute safety to workmen operating the switches,

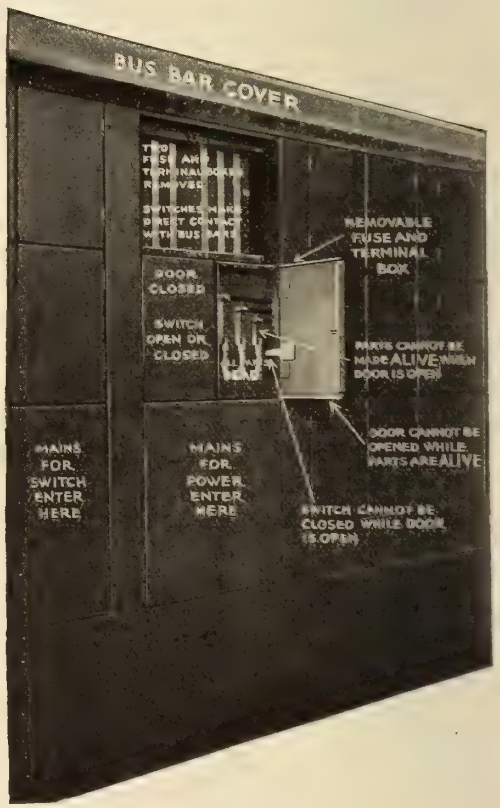


Fig. 1.

renewing fuses, or walking around the board. The unit construction of the board, with each switch in a separate compartment, is best seen from the rear view, Fig. 1. Each of the smaller sections represents a switch unit and each of the larger sections represents compartments for bus bars, wir-

ing gutters, and pull box. The switch unit, as shown in Fig. 2, consists of the enclosing box, the slate base on which the fuses, terminal lugs, and switch contacts are mounted, the switch proper, and the operating lever. The bus bars are mounted on the back of the switchboard slate and when the switch unit is inserted the blades of the switch make direct contact between the bus bars and the fuse terminals. These switches are all interchangeable and may be readily replaced by a switch of larger or smaller capacity, should the occasion arise. Nothing is mounted on the front of the switchboard except the switch handles and a card holder to indicate the circuits controlled by the switch. Since the switch handle is not connected with any surrent carryiing part, the front of the board is absolutely safe. At the back of the board no live parts are exposed, as everything is totally enclosed. If all the switches are closed so that the fuses are alive, all the fuse doors are automatically locked. Should it be necessary to renew a fuse, the switch affected is thrown off and then the switch door can be opened, as shown in Fig. 1. All the current carrying parts are now dead, however,

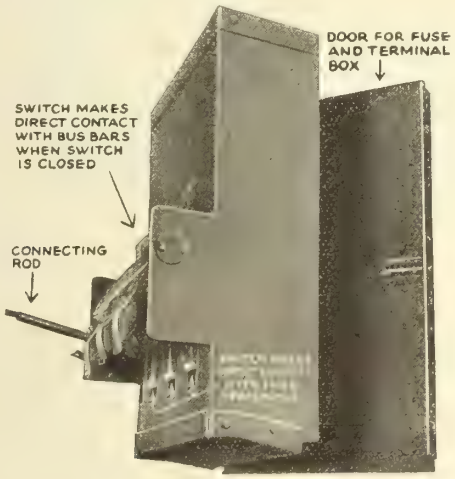

Fig. 2.

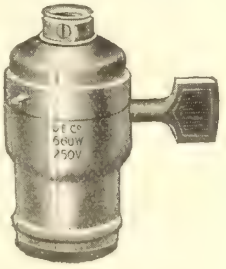
and the fuses can be removed without danger. It is also impossible for one man to close a switch when another is renewing the fuses, for the door must be closed tightly before the switch can be thrown on and the fuses energized.

The switch itself consists (when single-pole) of a movable arm. When closed, one end of the movable arm is pressed against the bus bar, and the other end against the fuse terminal, thus bridging the gap between them. When the switch is open, both ends of the arm are clear of their respective contacts. The switch is, therefore, double-break, and when open, leaves the entire fuse box dead. The switch arm is laminated, and makes contact under considerable pressure. It opens with a quick snap, no matter how slowly the operating handle on the front of the panel may be moved. All parts which are not necessary to reach in normal operation are protected by covers held in place by screws. These are readily removed, however, in case of necessity, and every part can be reached for making connections, replacements, etc. The wires can come in at the top or at the bottom and those feeding the switches on the right hand side of the board are placed in the right-hand gutter; those feeding the left-hand switches, in the left-hand gutter. All branch wires are accessible, with the switches open or closed, but no live parts are exposed. No wires cross the bus-bars or the cable terminals.

The Ottawa and Hull Power Company has under consideration the installation of two additional units, each of 7,500 h.p. A considerable amount of construction work has already been done.

Individually Boxed Fixtures



The illustration herewith shows fixture No. 7510, twelve inch, one of the new lines manufactured by W. H. Banfield & Sons, Limited, Toronto. They are furnished in brush brass, Flemish, rich gold, matt, or chocolate bronze. It will be of interest to jobbers and dealers to learn that all of these fixtures are boxed and sealed in individual packages at the

factory, thus eliminating the liability of damage to the finish or the possibility of missing parts. This innovation will prove of value to the dealer where stock has to be repacked and shipped.

New 660 Watt Socket

The Duncan Electrical Company, Limited, of Montreal, are now manufacturing a 660 watt, snap cap, quick-make-and-break brass shell socket, in ⅛ in. and ⅜ in. key and keyless. These sockets are practically adapted for fixture work, as

a narrow groove in the neck of the cap permits a wide turning of the socket even after it is firmly fitted on the stem. The holding catches on this shell and cap are so arranged as to provide a maximum of strength and rigidity.

The Civic Commissioners of Montreal and the Tramways Commissioners have granted to the Montreal and Southern Counties Railway Company an extension for ten years of its contract with the city of Montreal, dating from June 18th. The company will extend its line so as to obtain a connection with the lines of the Montreal Tramways Company and also to enable it to deal more expeditiously with the traffic at the terminal.

Current News and Notes

Aurora, Ont.

The contract for light and power between the town of Aurora and the Toronto and York Radial Railway Company, having reached the time of its termination, the council have notified the railway that they desire another five-year renewal on the same terms and conditions.

Chatham, Ont.

W. H. Somers, of the maintenance department of the Hydro-electric Power Commission, was electrocuted at the Kent sub-station on May 20 by coming into contact with a switch carrying 26,000 volts.

Edmonton, Alta.

New rates on Edmonton street cars came into effect on May 1, as a result of which the cash fare has been increased to 7 cents till 11 p.m., after which the fare is 10 cents. The revised rates fixed by the council are as follows: Tickets purchased off the cars at ticket-selling stations, 5 for 25 cents; tickets bought on the cars, 4 for 25 cents. No workmen's tickets are now issued. Children under six years old are carried free. Tickets for children over six and under fifteen years old and high school pupils carrying certificates, 10 for 25 cents, or one-half fare. Children after 11 p.m. to pay one-half fare. Between 5 and 6.30 p.m. 5 cents to be charged for baby carriages and large parcels. No change has been made regarding transfers on cars.

Eburne, B.C.

A new electric furnace is being installed by the Pacific Steel Works at Eburne, B.C.

Hull, Que.

The Hull Electric Company, Hull, Que., have commenced paving and double tracking their line from Aylmer Road to Montclair Avenue on Montcalm Street and the Chelsea Road—a distance of about one and one-half miles. It is expected to complete the work this year.

Kenora, Ont.

The town council of Kenora, Ont., have adopted a special domestic rate during the months of June, July and August, the price being fixed at 2 cents per kw.h. It is hoped to encourage the use of electricity for cooking.

Montreal, Que.

The first full year's statement of the Montreal Light, Heat and Power Company since the amalgamation of that company with the Cedars Rapids Power Company, shows a gross revenue for the year ending April 30, of $10,390,684. Operating expenses and taxes for the year were $4,767,869. After deducting other charges amounting to $1,039,068 and fixed charges the amount available for dividends is $3,588,725, or 5.6 per cent. on the capital stock. After providing for the annual dividend of 4 per cent. and $20,000 for the pension fund, the total surplus is $1,585,313.

The Corporation d'Energie de Montmagny, Limited, has been formed, with a capital stock of $400,000, to manufacture, purchase and distribute electric power, light and gas in the counties of Lotbiniere, Levis, Dorchester, Beauce, Bellechase, Montmagny, L'Islet, Kamouraska, and Temiscouata. Authority is also taken to acquire and develop water powers and to build conduits, etc.

New Westminster, B.C.

Two more electrically operated lumber plants are being erected on the War Whoop Road and McFarland place, near New Westminster, B.C. With the completion of these two new industries there will be seven electrically operated mills in this immediate neighborhood.

Ottawa, Ont.

The Ottawa city council have named a committee to conduct negotiations and report on the possibility of acquiring the plants of the Ottawa Electric Company and the Ottawa Gas Company, which are controlled by the Ottawa Light, Heat and Power Company.

Perth, Ont.

The High Falls power site at Perth, Ont., has been purchased by the Hydro-electric Power Commission of Ontario, although immediate development is not contemplated.

Peterboro, Ont.

It is stated that the city of Peterboro will shortly employ motorwomen, as well as conductorettes, on the street railway.

Regina, Sask.

A motion introduced in the city council of Regina to increase light and power rates twenty per cent. was defeated but on amendment it was decided to boost the rates ten per cent. The plant has been running at a loss for some time.

Southampton, Ont.

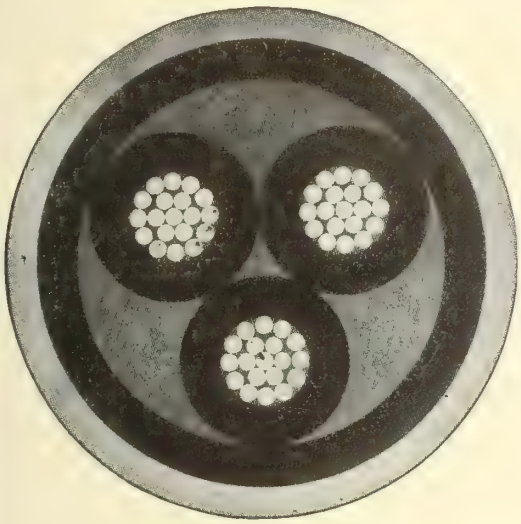
The Saugeen Electric Light and Power Company, Limited, Southampton, Ont., have called tenders for a concrete dam to replace their wooden dam on the Saugeen River carried away by spring freshets. The total width of the dam is 450 feet, of which 150 feet was constructed of concrete in the year 1913 and 100 feet more last year.

Toronto, Ont.

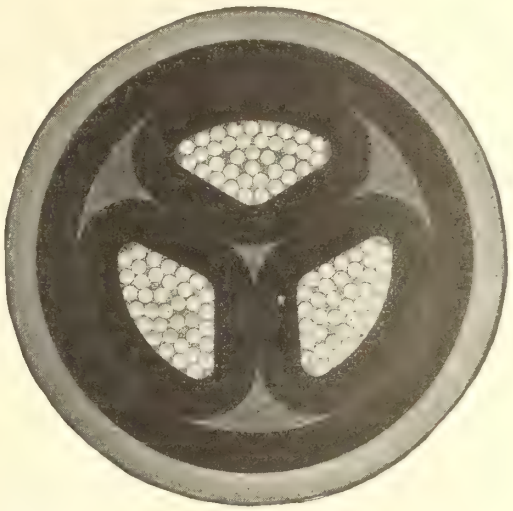
The Toronto Street Railway Company plan putting several p.a.y.e. cars in service shortly.

Vancouver, B.C.

The city of North Vancouver, through Mayor Vance, is endeavoring to secure electric power for industrial purposes at cheaper rates than those in vogue at present from the power supply company operating in the city. Mayor Vance promises a scheme to secure the necessary energy at $50 per h.p. at North Vancouver. From his statement it appears that the Nairn Falls Power Company is offering to the city its water rights (at present conditional), situated at Green River, on the P.G.E. Railway about 90 miles from North Vancouver, for the sum of $75,000. The cost of carrying the installation to the city, with the necessary power plant, is estimated at about two and a half million dollars, the horse-power developed to be about 50,000.



Winnipeg, Man.



The March report of the Hydro-electric System of the city of Winnipeg shows a surplus of $6,462.64. The operating revenue was $89,815.22. The total expenses, including operation, were $83,352.38. The surplus at March 31 was $236,231.08.

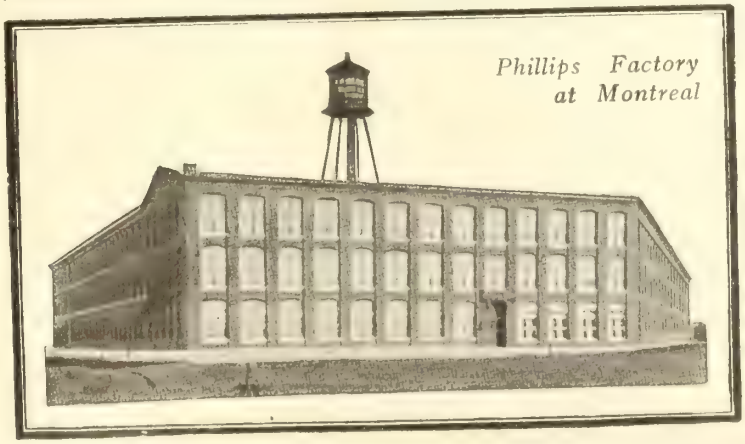
Just as we go to press announcement is made that Winnipeg's strike of civic employees is practically at an end. About three weeks ago the city electricians, waterworks men and health department teamsters struck for higher wages and the dispute eventually involved nearly 15,000 workers of all kinds. It is said that concessions are being made on both sides and the strikers are now all back at work.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in.. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Eugene F. Phillips Electrical Works, Ltd.

Head Office and Factory: MONTREAL

Branches: Toronto Winnipeg Regina Calgary Vancouver

Phillips Factory at Montreal

FOR SALE

Duty tungsten or nitrogen, 5 light cluster fixtures, 20" dia. porcelain enameled steel reflector. Malleable iron cross arms, pony glass insulators. High tension mica insulating joint, tested to 34,000 volts. In service for short time. 200 Alabaster Balls, 12 in. x 12 in. x 6 in. fitter. Enquire New

For information regarding the above apply to Galt Hydro-Electric Commission, 50 Dickson St., Galt, Ont. 10-11

MATERIAL FOR SALE

The Toronto Electric Commissioners have for sale a quantity of second-hand 60 cycle transformers, recently in service, also a quantity of electrical supplies. List of materials and full particulars may be obtained on application to the Purchasing Agent, 30 Murray Street, Toronto. The quantities are not guaranteed, and are all subject to prior sale.

No tender necessarily accepted.

Tenders to be in not later than June 5th. 11-11

FOR SALE

1 Madison Williams 30 in., 200 h.p. Triumph Horizontal Steel Case Turbine Water Wheel, 25 ft. head, complete with pulley.

1 60 kilowatt, 2300 volt, 3 phase, 60 cycle, 1200 r.p.m. belted generator with pulleys and rheostats and exciter, Crocker-Wheeler make.

8,166 pounds No. 6 B&S hard drawn bare copper line wire.

POSITIONS VACANT

WANTED Draftsmen with experience on transformers, induction motors, or direct current machines. Apply stating experience and salary expected, to Box 731, Electrical News, Toronto. 9-11

WANTED—Several experienced draftsmen, more particularly those having experience in switchboards, also draftsmen having experience in generators and transformers. In applying state previous experience, where at present employed, salary expected. Apply Works Engineer, Canadian General Electric Co., Peterboro. 10-11

Is the Electric Motor Cycle Practicable?

Since the earliest days of the electric vehicle, writes the Electrical Times, the possibility of running a cycle on this system has fascinated many enthusiasts, and led to numerous suggestions for a practicable design. There is, of course, nothing inherently impossible in the idea—a machine can be built that will run a reasonable distance at a satisfactory speed, at least on the level, with a motor and battery carried within the frame. It is stated that one firm is placing on the market an electric cycle that with a lead battery will cover 75 miles, or with nickel-iron cells, 150 miles on a single charge, at speeds up to 35 miles per hour. It does not follow, however, that such a cycle would be a commercial proposition, and it is doubtful whether the maximum speed mentioned could be maintained for any length of time without injury to the battery or motor, or to both. The weight of the cycle is given at 225 lbs., and its selling price at $250 with a lead, and at $375 with a nickel battery. The electric cycle would give little trouble, should not be costly to run or to maintain under suitable conditions, would be easy to keep clean, and would make no noise and create no smell, while its simplicity of construction and of control should appeal to those who hesitate to acquire a motor cycle because of its complexity and liability to breakdown. With the electric cycle, of course, there would be no difficulty with the lighting problem, no seperate generator being needed.

ALTERNATING CURRENT

2—100 K.W., General Electric, 3 phase, 60 cycle, 2300 volt generator, type GTB, form D, complete with switchboards.

1—200 KW., 3 phase, 60 cycle, 1100 volt, General Electric generator, type GTB, form D, speed 600.

1—450 K.V.A., 2300 volt, Allis-Chalmers, 200 speed, 3 phase, 60 cycle generator, 2 years old, good for direct connection for engine drive or water wheel drive.

1—100 H.P. new Westinghouse motor, 3 phase, 60 cycle, 550 volt, 900 speed.

1—100 H.P., new General Electric, 3 phase, 60 cycle, 440 volt, 720 speed, slip ring, complete for heavy starting duty.

1—50 H.P. new General Electric, 440 volt, 1200 speed, 3 phase, 60 cycle, slip ring motor.

1—50 H.P. General Electric, 220 volt, 900 speed, type I, form L.

2—50 H.P. new Allis-Chalmers, 550 volt, 3 phase, 60 cycle, 900 speed motors.

MOTOR GENERATOR SET

1—40 KW., 125 volt, General Electric, 720 speed, type CL, form B, 6 pole generator, connected on one sub base to a 60 H.P., 3 phase, 60 cycle, 2080 volt, 720 speed, type M, form C, Fort Wayne motor in A1 condition and complete. Three bearing machine.

DIRECT CURRENT

2—100 H.P., 110 volt, Holtzer-Cabot D.C. motors, 550 r.p.m., full commutators.

1—10 KW., 125 volt, Bullock, 400 speed, marine set, direct connected on one sub base to a Westinghouse vertical engine.

1—50 KW., 125 volt, General Electric, 280 speed, type MP generator, direct connected to an 11 x 12 vertical marine type engine.

1—300 KW., 500 volt, D.C. General Electric generator, 400 r.p.m.

1—56¼ KW., 125 volt Westinghouse, 800 speed, type M generator, complete and in A1 condition.

1—80 KW., 125 volt, Crocker-Wheeler, 750 speed, type CCD generator.

1—90 KW., 110 volt, General Electric, 690 speed, type CL, 6 pole, form B generator.

1—300 KW., 550 volt, General Electric, 400 speed, type MP generator, D.C.

BOILERS

3—300 H.P. Holyoke Manning Boilers, now located in Massachusetts; good for 150 lbs; 11 years old, in splendid condition.

5—150 H.P. Manning Boilers, now located in New Hampshire; good for 135-140 lbs. Immediate delivery.

6—90" x 18' 6" horizontal return tubular Dillon Boilers, now located in Rhode Island, installed in 1905, for delivery in 2 months.

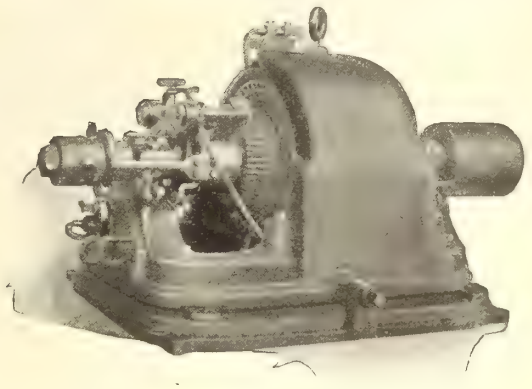
You Know the Noise!



caused by commutators sparking and flashing—the result of undue friction between brushes. This trouble can be cured by fitting your machines with

No-Spark Carbon Brushes

They run smooth, do away with the continual cleaning, replacing and resetting because these brushes are frictionless and self-lubricating. Try "NO SPARK" Brushes. Other engineers are enthusiastic over them. Why not you?

CALEBAUGH
Self-Lubricating Carbon Co.
1503 Columbia Ave., PHILADELPHIA, Pa.

The Prototype Motor

The first successful singlephase motor was Wagner-Quality. Backed by years of engineering and manufacturing experience, the Wagner Singlephase motor of today is the paramount motor.

BOXED FIXTURES

Just what you have been looking for MR. JOBBER and DEALER

Our new line of complete fixtures. Each fixture packed complete to a box, and sealed at our factory, eliminating **DAMAGED FIXTURES** and **MISSING PARTS**, ensuring safe arrival of good clean stock to your customer. Convenient for jobbers where stock has to be repacked and reshipped.

Ready for shipment June 15, large circular showing this complete line will be mailed to every customer at an early date. Look for it.

On June 1st, we will Move to Our New Showrooms and Sales Department, at 80 King Street West, Toronto, where we will be glad to welcome all old and new customers.

HAMILTON - CANADA

Manufacturers of High and Low Tension Porcelain Insulators

Aboard Uncle Sam's battle ships too stringent care cannot be taken to prevent overloads and short circuits reaching the electrical equipment. This is effectively safeguarded against by the use of

ECONOMY renewable FUSES

No one can question for a moment that safety is the first consideration in the fusing of these circuits. What greater assurance could be offered of the accuracy and all-around dependability of Economy Fuses?
Now weigh the fact that ECONOMY renewable FUSES and "Drop Out" Renewal Links cut annual fuse maintenance costs 80 per cent. A single order recently shipped to one Navy Yard saved the government over $76,800.00. Smaller users enjoy the same proportionate saving.
Order from your electrical dealer. Write for Catalog 20.

An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

OXY-ACETYLENE WELDING & CUTTING

Bakers' Dough Vat, All Welded, Manufactured by Brantford Oven and Rack Co., Brantford, Ont.

Economy and Efficiency in Your Manufacturing

Increased Profits in Your Sales

Not only in most cases is the Process of Manufacturing Products of this nature simplified by the Oxy-Acetylene Process, which tends to greater production and a saving in cost, but the welded joint, being perfectly homogeneous and with no inherent weakness, entails no risk of leakage at the seams when subjected to extremely hard use. After machining, it is impossible to detect the joint, which contributes to the higher quality of the article produced and adds to its commercial value.

The applications of the Process in your Industry are manifold.

WRITE FOR PARTICULARS

L'AIR LIQUIDE SOCIETY

Manufacturers, in Canada, of all requisites for the Oxy-Acetylene Process.

TORONTO. MONTREAL. WINNIPEG. HALIFAX.

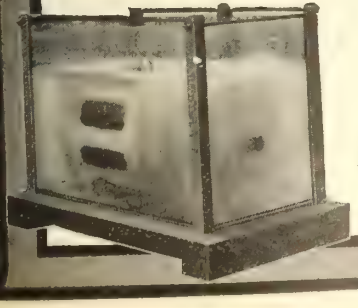
LINCOLN MOTORS

More Power To You

That's just what it would mean if the metal working plants in your territory could be given only a glimpse of the possibilities in electric arc welding.

There isn't a piece of apparatus made which will return you more power sales for little effort than

The Lincoln Arc Welder



Every steel foundry, forge shop and stamping plant in your territory — every plant where metals are joined or breakage and wear of metal repaired—50 per cent. of the shops where acetylene is used—are prospects for electric arc welding.

You do not have to sell them, just interest them and we will send our welding engineers to go over the proposition and close the sale.

Write us for literature and information on any welding job you run across.

The Continued Success

of

Colonial Copper Clad Wire

TRADE C.C.C. MARK

is due to the perfection and continued supremacy of weld between the copper and steel, and an expert knowledge of and skill in the production and uses of high grade electric wire and cable products.

For over 10 years C.C.C. Wire has maintained its supremacy. During that period it has been continuously produced according to the same methods in millions of pounds yearly for the most exacting buyers of wire products for electrical uses.

Colonial Copper Clad Wire has been produced continuously for a longer period and in larger quantities than the combined quantities and periods of manufacture of all other past or present competitive products. It has stood the acid test of time in service tests and unbroken continuity of manufacture as no other wire has done.

It is probably not overstating the case to say that Colonial Copper Clad Wire is the only copper clad wire that has been produced in which a thorough weld is secured between the copper and the steel—a weld made by pressure between two accurately centralized, previously treated and prepared plastic metals, on exactly the same principle that the blacksmith welds his two pieces of iron into a single piece of equal or greater strength than the original bars. The most exacting tests of twisting, pulling, hammering, heating, and quenching, immersion in acids, etc., fail to indicate that the union between copper and steel in Colonial Copper Clad Wire is not of a strength substantially equal to the strength of the copper itself. A weld of this sort must not be confused with a union where the metals are merely melted together.

Do not be misled, but write for Bulletin No. 202 for further information about C.C.C. Wire.

Standard Underground Cable Co. of Canada, Limited

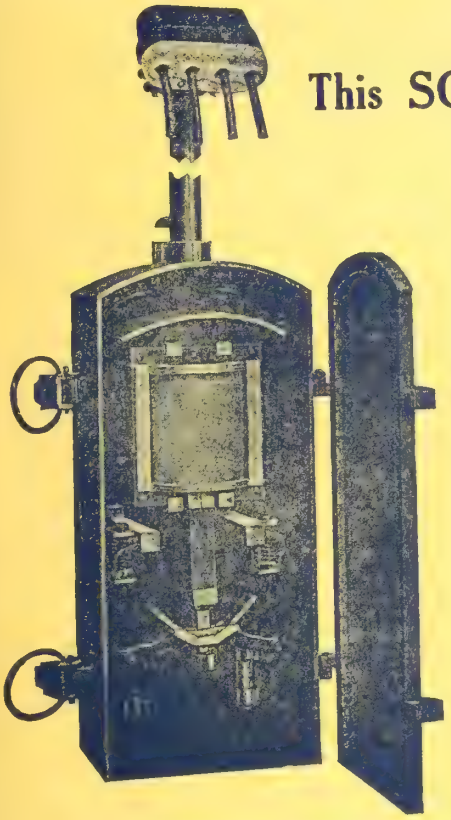
Westinghouse
Electric Ranges

Type 3-19 Automatic Electric Range with Clover-Leaf Set and Cooker Pot in Small Oven, and Turnover Toaster attached.

These ranges have the exclusive economical feature of full automatic control by attached clock and thermostat.—They are strongly constructed throughout, all parts being of metal.—For the ovens the best, practical, rust-resisting metal known is used, covered on the inside with an aluminized finish which is a further protection against rusting.



The ovens are heavily insulated with the finest grade of rock wool, which reduces the escape of heat to a minimum.—A specially designed heat distributor produces an even temperature.

All parts of the range are readily accessible. Everything can be removed from the ovens, and the ovens flushed with water with no evil effects.

Our Catalog 8-D describes the full line—Send for a copy

Canadian Westinghouse Co., Limited, Hamilton, Ontario

Toronto	Montreal	Ottawa	Halifax	Ft. William	Winnipeg	Edmonton	Calgary	Vancouver
Traders Bank Bldg.	52 Victoria Sq.	Ahearn & Soper Ltd.	105 Hollis St.	Cuthbertson Block	158 Portage Ave. E.	211 McLeod Bldg.	Grain Exchange Bldg.	Bank of Ottawa Bldg.

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

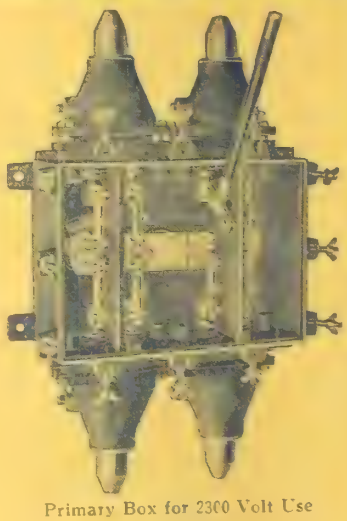
G&W ELECTRIC SPECIALTIES

The Essential Details of G & W DISTRIBUTION BOXES

are very carefully perfected



In the primary box illustrated, switch blade action is combined with bolted contact efficiency
Unit cable potheads with ample compound space make an easy installation without sacrifice of safe, permanent cable end insulation.

The entire box is lined with insulating material—all bolt heads, etc., are covered and different polarities are thoroughly barriered.

In the secondary box double U clips give better contact alignment than would a single U clip.

The unit cable potheads attach at an angle, gaining roominess without using excessive wall space.

The line of this material is complete, offering constructions suitable for all conditions.

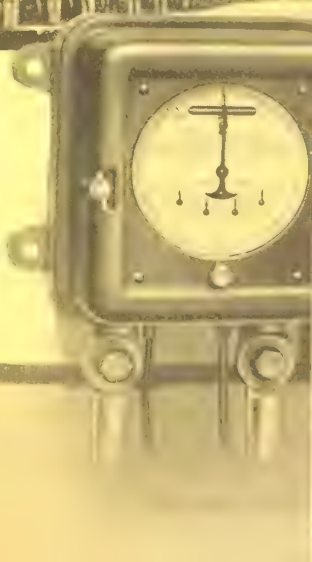
Generation, Transmission and Application of Electricity



A "Battery" of Bread Wagons Operated on the Amperehour Principle

SANGAMO
BUILT LIKE A WATCH

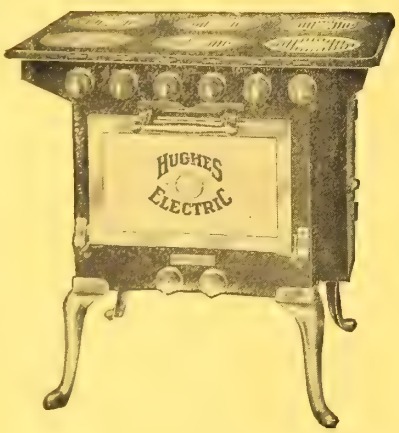
The Amperehour Meter is the most convenient and one of the most reliable methods of determining the state of charge of the battery. It is the **only reliable means for automatically terminating the battery charge** when the proper amount of overcharge has been given the battery.

That is why the Purity Bakery of Minneapolis—whose equipment is shown above—and thousands of other important users of storage batteries for electric vehicles, trucks, railway train lighting equipment, farm lighting plants, wireless telegraphy, etc., are using Sangamo Amperehour Meters. The Amperehour principle adds materially to the life of the battery because it prevents destructive over-charging. Let us send you full details.

Sangamo Electric Company
of Canada, Limited

Toronto Montreal

HUGHES
Electric Ranges



No. 50

HUGHES "50" ELECTRIC RANGE

This is one of the most popular styles of ranges on the market. Ideal for homes, suitable for medium or large size family, also for Clubs, Church Kitchens, etc.

Features, 4-burner cooking surface, 2-burner oven, warming compartment, outside warming shelf, lower outside shelf. Finish either plain or nickled with white enamel splashers.

No. 48

HUGHES "48" ELECTRIC RANGE

Extremely handy; designed for large families, boarding houses, restaurants, hotels, clubs, etc., where a greater cooking capacity is required in a small space.

Features, 6-burner cooking surface, 2-burner oven. Finish either plain or nickle plated.

No. 44

HUGHES "44" ELECTRIC RANGE

A very popular range because it uses little floor space and has elevated oven, exclusively for families of average size.

Features: 4-burner cooking surface, 2-burner oven, lower outside shelf. Finish either plain or nickle plated.

No. 27

HUGHES "27" ELECTRIC RANGE

The most desirable Range for small or medium size families with limited kitchen space.

Features, 2-burner cooking surface, 2-burner oven, elevated outside warming shelf. Finish either plain or nickle plated.

Electricity Makes Cooking Scientific and Economical

SCIENTIFIC—because they have introduced and adopted, virtually, every fundamental improvement in the development of the modern electric range—the most complete line of electric cooking apparatus in the world.

ECONOMICAL—because of economy of current, of food, of time and trouble. The HUGHES ovens are so constructed as to make it possible to turn off the current long before the food is cooked, because it does not shrink or dry out the food it cooks, hence an appreciable saving in market bills.

No. C-18

HUGHES RANGES are sold with a year's guarantee against defects electrical and mechanical, backed by the reputation of their makers. They are without doubt the best and most economical electric ranges on the market.

Awarded GOLD MEDAL, Panama Pacific International Exposition, 1915.

Tested and approved by the Underwriters' Laboratories of the National Board of Fire Underwriters—and also by Good Housekeeping Institute.

Write our House nearest you for further information as to literature, prices, etc.

HUGHES "C-18" ELECTRIC RANGE

It is solidly constructed of steel and cast iron, occupying floor space of only 17 x 25 inches, compact, neat, most suitable for light cooking. Finish plain black enamel.

O-B PRODUCTS

MODERNIZED INSULATORS

Harmonized design and manufacture have made possible the uniform reliability of O-B Porcelain Insulators.

The designs result from a complete understanding of transmission problems and a knowledge of the possibilities of well-made porcelain.

The manufacturing methods came from sure footed progress—ideas tempered by specialized experience.

There is a specific type of O-B Insulator for every requirement—usual or unusual—of station and line.

LINCOLN MOTORS

Weld and Win

Electric Arc Welding is proving a vital factor in winning the war. Startling evidence of this is accumulating every day.

Lincoln Arc Welders

are now giving the Rock Island Lines 1400 days more engine service per year by hastening their engine repairs. They say that a full equipment of these welders will be equal to the purchase of 23 new engines. And this is only one of many roads using Lincoln equipment.

These welders are saving days of time on vital ship repairs in large eastern dry docks.

They are increasing and speeding up the output of steel castings by filling with molten steel, blowholes, shrinkage cracks and other defects that would scrap 5 to 10 per cent. of the product. Steel castings are absolutely essential in locomotives, steamships, motor trucks and most of all in the actual fighting equipment, cannon, machine guns, rifles, etc.

Get our 48 page illustrated book on welding and see what this wonderful equipment can do in the industry you are interested in. Write on your business letterhead.

Ask for Catalog 104-D.

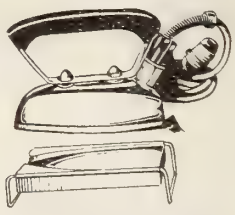
Every occasion that prompts gift-purchasing is an opportunity for the "Premier" dealer.



IN the past a good many electrical appliances have been bought rather thoughtlessly — by folks who wanted merely the convenience that electricity brings. But there will be less of this kind of buying in the future. There will be more inquiring into merit, into design, construction, finish. That's the thought most dealers have in mind when adopting the new "Premier" line. They realize that in the "Premier" organization are men who have grown up with the industry; men who are known throughout the trade as progressive. At a glance they know that "Premier" appliances are "all that the name implies." And the advertising campaign now running is but the forerunner of our effort to warrant their faith in becoming "Premier" dealers. You can't afford to judge the "Premier" by your previous experience of electrical appliance makers. Get in touch with the "Premier" men themselves, know the goodness of "Premier" appliances, learn the handsome margin of profit they allow. Act on the impulse—write now.

PREMIER Electrical Appliances

"All That the Name Implies"

Absorbs the Shock

Our special C. & H. Poly-Phase Meter is safe because it is fitted with new double terminal blocks that absorb the shock and reduce the danger of accident resulting from overloaded wires and from surge conditions during lightning storms.

This meter also has more inside room for the connections, and the three or four lines are carried straight through the meter from the left to right. In every respect this C. & H. Poly-Phase is a Safety Meter, and is undoubtedly the one to select for Installation on Long Distance Transmission.

C&H Poly-Phase The Safety Meter

The Company's guarantee goes with every instrument. The new Poly-Phase is as near perfect as it is possible for a meter to be.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Benjamin "All Copper" Made-in-Canada Knife Switches

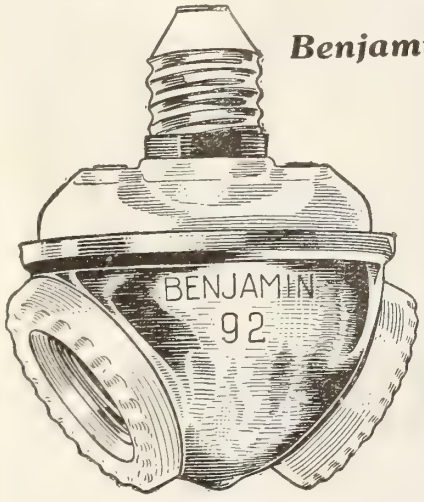
Benjamin "All Copper" Knife Switches are built in accordance with the Underwriters' latest rulings and recommendations.

Great care is exercised in their construction and the materials used are of highest quality.

The current-carrying parts are made from pure hard drawn copper, and slate is especially selected for our use.

The fibre used is selected with great care, and is especially treated before being made into cross-bars, and other insulating parts.

Our switches are so built that they will easily carry a heavy overload, and much attention is given to the details of construction of jaws and hinges, so that arcing will be at a minimum, and the make and break as nearly perfect as possible.



All the elements of switch construction have expert attention, and the workmanship is high class in every respect, insuring for our products long life and great carrying capacity..

We are in position to furnish all kinds and types of special switches for service boxes, switch-board and other work.

"MADE-IN-CANADA"

Electric Lighting Specialties

Including Plug Clusters, Attachment Plugs, Sockets, Shades, Etc.

Benjamin Plug Clusters— Two-Way Plug

The easiest, quickest and best way to obtain two outlets from one socket. No extra wiring, or great expense. Just simply screws into the socket, like a lamp. Also supplied for 3 and 4 outlets.

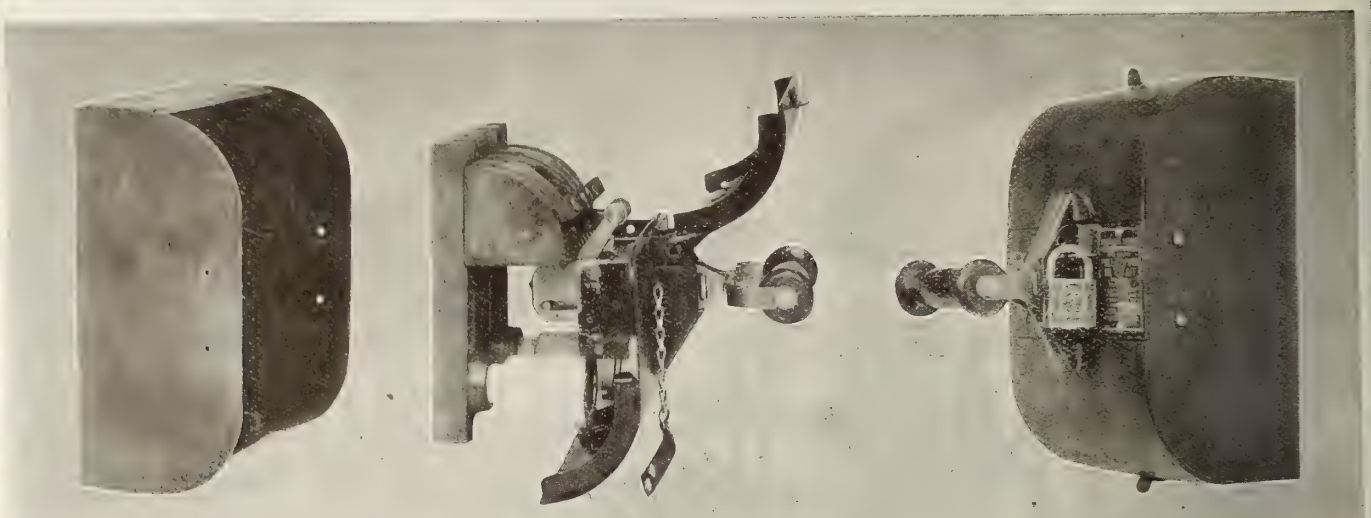
Benjamin Reflectors

Are scientifically designed to give the best results in illumination, and special attention is also given to the quality and finish to ensure durability.

Benjamin Sockets

Standard Brass-Shell Sockets as shown in the accompanying illustration are one of our specialties. Full line includes Twin Sockets, Mogul Base Sockets and "Benco" highly-insulated, high-duty sockets.

Benjamin Swivel Attachment Plugs



An ingeniously devised swivel shell makes it possible to affix or remove the plug quickly without twisting the cord.

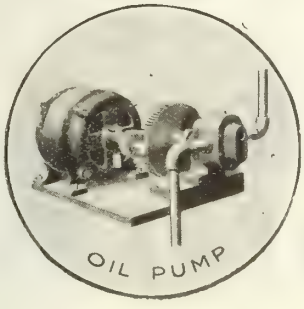
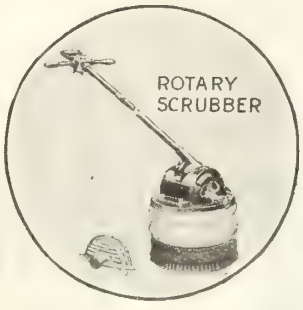
25 Reasons



The "Ten Thirty Eight" Switch for Starting Small A-C Motors



1. It is enclosed in steel.
2. Wood handle is non-conductive.
3. Fits the hand.
4. Covers open for inspection.
5. Covers locked during use.
6. Switch locked during non-use.
7. Cover won't open if switch is closed.
8. An accidental push will open the switch.
9. A pull closes it.
10. Four screws hold entire front of switch, including covers.
11. Protective plugs prevent continued overloads on the motor.
12. A fusible link is the only supply part necessary.
13. Links same for all switches.
14. Switches same for all motors.
15. The plugs are the only variable unit and can be furnished for AC Motors up to 5 h.p.
16. Links cost less than fuses.
17. And can be carried in vest pocket.
18. Switch has moulded compound barriers.
19. Approved by fire underwriters.
20. Holes drilled for wall mounting.
21. Arranged for conduit wiring.
22. Thousands in use.
23. Thousands more on the way.
24. You can order them at any place where they sell C-G-E motors.
25. And the price is low. Ask our nearest agent or get prices on quantities from our nearest office.

Robbins & Myers Fans

IF you would take this fan apart and examine the workmanship of each detail you would understand why the R & M Fan has earned such an excellent reputation for reliability and long life.

Accurate workmanship and high grade materials have reduced friction and wear to a minimum. Note the careful adjustment of the oscillating mechanism, the accurate fit of the bearings, and the perfect balance of the blades and rotor. Everything which the most highly skilled workmanship can contribute to efficiency, reliability, and long life is seen at its best in the R & M Fan.

When you sell a customer an R & M Fan you sell him real fan service and win his permanent good-will.

No Reason for Hazard in Farm Lighting Plants

Mr. A. O. Fisher, provincial fire commissioner, of Regina, is quoted as stating that the public favor with which the small farm and rural electric light plants are meeting has resulted in the creation of a new fire hazard and that his department has been forced to give consideration to the best methods of preventing extensive fire loss throughout the province by the introduction of this new method of rural lighting.

It is unfortunate if the impression should get abroad throughout the farmers and other rural residents of Saskatchewan or any other province of the Dominion, that electric light plants are dangerous either to life or property. If properly installed, they cannot be said to constitute any hazard whatever. As a matter of fact, gasoline engines have been installed for many years in the barns and barn basements of many farmers, constituting a very dangerous hazard, with surprisingly few disastrous results. The explanation doubtless is that farmers have been warned of the possible dangers and, being naturally of cautious disposition they have taken the necessary care. Farmers, in general, do not carry as much insurance as they might and rarely think of adding to the amount when their barns are temporarily filled with grain or stock. On this account they have learned to be doubly cautious. Under these circumstances there seems no reason whatever why rural electric plants should constitute any hazard, and it can only be by the grossest carelessness in installation or operation that such would be the case.

It is just possible that in their endeavor to keep the cost of the plant and the installation down to the lowest possible figure, certain makers are failing to use ordinary precautions. Possibly also, they are making light of the dangers inherent to electricity. The former is something that each government should be watchful of. As much care should be taken in the installation of an electric plant in a rural home as is required in a city home. Nor can we see that manufacturers or dealers in these small plants can hope to gain anything by minimizing the possibilities of danger. Much better that they should explain the possibilities and at the same time make it plain that these possibilities can be removed beyond the shadow of a doubt by the use of common sense and every-day caution.

The introduction of the isolated electric lighting and power plant into farm and other rural homes is one of the greatest blessings of the present age, and it would indeed be a great pity if any errors in judgment should interfere with the steady progress which is being made toward the more general use of such equipment.

Labor Unions Do Not Hesitate To Tie Up Industries of a Great City

Street railway transportation in the city of Winnipeg, Man., was tied up for three days during the week of May 18th, owing to 1,000 employees of the Winnipeg Electric Railway Company striking, in sympathy with civic employees who struck for a raise. The strike, which involved 15,000 workers in over a dozen unions was the most disastrous in the history of the city and from the time that the first civic employees walked out until a settlement was effected was over a month.

The city was without street car service on one of the most important holidays of the year, Victoria Day, May 24th, being the first summer holiday, and the tieup, while it only lasted three days, caused inconvenience to thousands of workers, who living in the outlying districts, had to walk in many cases as much as six miles to get to their places of employment. Hundreds of owners of motor cars co-operated at the request of the civic authorities, and at the rush hours a continuous string of cars could be seen passing up and down the busy thoroughfares.

The street car men walked out on the morning of May 22nd and a settlement was reached at noon of the 25th. The settlement was effected as a result of the visit of Senator Gideon Robertson, of the Dominion Government, who acted as a mediator, and who at the time the street car men struck was on his way west. The street car men were called out as a last resort by the striking committee, and this action was considered the trump card.

A magnificent spirit of cooperation was manifested throughout the city in a desire to keep the public utilities running. Society women who did not know the meaning of work manned the telephone switchboards and helped to maintain a service for a week that the operators were out. Girls in railroad offices dropped their pens, donned overalls and hustled trucks when the freight handlers joined the striking unions, and private motor car owners acted as jitney drivers in their desire to assist those to their work who had long distances to travel.

The underlying motive of the strike was not based entirely upon the refusal of the city to grant increases in the different departments, but rather on a point of principle. The city maintained that employees should arbitrate matters of this kind in war time. Labor spokesmen asserted that the life of unionism rested solely upon the right of labor to strike to procure their demands. The thorn in the flesh insofar as the city was concerned was due to the fact that about three-quarters of the firemen who had lately formed a union were the first to go out in sympathy, leaving the city without adequate fire protection. The basis of the agreement finally

reached was that all matters affecting increase in wages should be arbitrated with a strike as the last resort.

The Winnipeg Electric Railway Company suffered the loss of thousands of dollars in revenue as a result of the rolling stock being tied up over the holiday, May 24th came on Friday, and preparations on a large scale had been made for entertaining the public at the various parks. Up until noon of the holiday hopes were held out that an agreement would be reached that day and crews were at the various barns waiting to take their cars out. The walkout from a street railway standpoint was very regrettable owing to the fact that only last winter a new schedule had been drawn up for street car men, providing for increases in all branches, and the best of relations exist between the company and its employees.

The Shortage of Engineers

The United States is now beginning to appreciate one of the difficulties that we have been meeting in Canada for some time, namely the shortage of engineers. In a recent letter from President Wilson to the Dean of the College of Engineering of the University of Michigan, the importance of maintaining the number of engineering students was urged. President Wilson expressed the greatest concern at the falling off in the number of students in the engineering department, stating, "there is not only immediate necessity that as many students as possible should prepare themselves for engineering duties in the army and navy, but it is also of first consequence to the country that there should be an adequate supply of engineers for the period of reconstruction which must follow the war."

It was stated that the attendance in engineering classes since the United States entered the war has fallen from 25 to 35 per cent., and that the graduating classes this year were not more than half their usual size. This approximately represents the condition of Canadian colleges after a year of war, and the United States will do well to prevent the crisis which has arisen in our own universities. The fact is that in the engineering departments of both Toronto and McGill—and doubtless it is so in the other universities—the graduating class reaches the vanishing point before the course is completed. In certain of the courses where the demand for men is greatest, there are no students beyond the second year. Canadians are endeavoring to rectify this serious condition, but the process is slow and it would have been ever so much better if precautions had been taken at an earlier stage in the war.

A Dominion Power Board

The question of an adequate supply of fuel and power for all of Canada is one which has been brought sharply into view as a result of the acute fuel shortages during the past two winters. Certain phases of the situation demand and are receiving immediate action through the Fuel and Power Controllers and the Honorary Advisory Council for Scientific and Industrial Research. The general problem of the fuel-power requirements of Canada is one that the end of the war will not solve. It is not merely a question of looking ahead for a year or two years or for whatever time the present conflict may last, but rather a matter of providing for all time to come.

Canada is recognized as one of the greatest water power and coal countries in the world. No people enjoy to a greater degree the benefit of cheap, dependable hydro-electric power, and none have had this benefit more universally adapted for municipal, industrial and domestic use. Canada's resources of coal are of tremendous extent, but are so located and of such a nature that special problems must be solved before they are made available to their maximum possible extent for domestic and manufacturing purposes. The future progress of the country depends very largely on the development and use of all the available fuel-power resources. To realize this, the Government has formed a Dominion Power Board, comprising nine permanent officials of the various departments, who have become, as a result of their regular departmental work, recognized authorities on varied aspects of the fuel-power problems of the country. This Board has also been charged with the responsibility of co-ordinating all the investigation activities of the Government with regard to fuel-power resources.

The Board has two main functions: (1) the collection of information (i.e., Intelligence Service); and (2) to advise upon the development and use of fuel-power resources of the country (i.e., an advisory body). The Honourable Arthur Meighen, Minister of the Interior, is Chairman of the Board. The members are comprised of the following officials:—Arthur St. Laurent, assistant deputy minister, Department of Public Works; C. N. Monsarrat, consulting engineer, Department of Railways and Canals; W. J. Stewart, consulting engineer, Department of External Affairs regarding International Waters; John Murphy, electrical engineer, Dominion Railway Commission; H. G. Acres, chief hydraulic engineer, Hydro-electric Power Commission of Ontario; O. Higman, chief electrical engineer, Department of Inland Revenue; D. B. Dowling, geologist, Department of Mines; B. F. Haanel, chief engineer, Fuel Testing Division, Department of Mines; J. B. Challies, chief engineer and superintendent, Dominion Water Power Branch, Department of the Interior.

The Electric Club of London

An organization has been formed in London, Ont., known as "The Electric Club of London." The aim of the Club is the mutual assistance and education of its members along technical and commercial lines, standardization of methods and electrical development. Membership in the association is open to all electrical contractors, electrical manufacturers, central stations and electrical jobbers and dealers doing business in the city of London and also to the local inspection department of the Hydro-electric Power Commission.

The officers and members of the Club are as follows:—President, B. W. Wilcox, Benson-Wilcox Electric Co.; vice-president, L. R. Folley, Commercial Electric Co.; secretary-treasurer, A. T. Taylor, Western Ontario Electric Co.; B. L. Baulch, Northern Electric Co.; Thos. Benson, Benson-Wilcox Electric Co.; W. R. Bowley; E. V. Buchanan, general manager, Public Utilities Commission; E. L. Campbell, Western Ontario Electric Co.; F. R. Dark; Frank Gray, The People's Electric Co.; J. C. Ingram; W. B. Legate, Hydro Inspection Department; W. H. Morgan, Canadian General Electric Co.; E. C. Morkin, Stewart & Morkin; J. H. Pollock; W. E. Rider, Hydro Inspection Department; B. E. R. Thomas, Hydro Inspection Department; J. Winegarden, People's Electric Co.; Wm. Stewart, Stewart & Morkin.

Employment for the Blind

Among other firms who are using employees that have been deprived of their sight, is the Westinghouse Electric & Mfg. Co. The particular class of work for which blind men and women show the greatest aptitude is the taping of coils, and at the present time the company have seven persons employed in this way. To date the quality of the work the blind employees turn out is quite satisfactory, but it is taking them a little longer than ordinary to get up their speed; this is only natural. A few issues ago we reported on a similar venture by the Crocker-Wheeler Co. It would appear from the satisfactory results obtained from the experiments already carried out that employment in this direction will be available for large numbers of returned soldiers.

The Overseas Distribution of Engineering Equipment and Appliances*

By Leonard Andrews, M. I. E. E.

Experience has shown that the country which carries out any original engineering work abroad usually secures the bulk of the subsequent trade of that country, created by the industries thus established. The British Empire owes its present industrial position to the fact that for many generations this country has been the recognised engineering workshop of the world, though in recent years Germany has made special efforts to undermine Great Britain's long-established lead. It is, therefore, a matter of the greatest national importance that British engineering industries should be fostered and developed to the fullest possible extent, and that, if necessary, State funds or credit should be applied to this purpose.

All who have visited engineering works in other countries —particularly in the United States of America and in Germany—must have been impressed by the fact that, as pure engineering craftsmen, British artisans can more than hold their own with any and all competitors, but that as an economic distributor this country has much to learn both from the United States and from Germany. Great Britain's superiority as a producer of engineering appliances is fully recognised by her competitors, and it would almost appear that both Germany and America—having recognised the strength of this country's position as a producer—decided to concentrate their attention upon improving distribution, and have thereby attained an exceedingly high state of efficiency in that particular respect.

Mere efficiency of production is, comparatively, of little value unless combined with efficiency of distribution. As many of the problems associated with overseas trade are so closely analogous to the difficulties which have been successfully overcome in distributing electrical energy, the past experiences of electrical engineers should enable them to render valuable assistance to the executive officers of the various organizations which at the present time are devoting so much attention of the improvement of British foreign trade.

The attitude of those manufacturers who cater only for trade f.o.r. their own works may be compared with that of a power-plant superintendent who only concerns himself with efficient production at the main bus-bars, and assumes that all questions relating to distribution are beyond his province; and who, moreover, considers that a reliable low-priced supply should be sufficient inducement to the consumer to make his own arrangements for the distribution and application of the service outside the generating station.

Naumann, in his "Mittel-Europa," says:—"In the last 20 years our German industries have assumed a wholly new appearance. Whilst growing they have grown into one another. Through employers' associations, buying arrangements, agreements as to prices and selling areas, a complex system of mutual attachments and dependencies has come into being. . . . This dovetailing of the individual-self into the community-self is what we are pre-eminently able to achieve. . . "

What Germany claims to have achieved in 20 years, the British Empire has accomplished in as many months. The conversion or aggregation of many thousands of industrial factories in all parts of the Empire into one huge arsenal for the manufacture of war material is, without question, the most remarkable example of the dovetailing, or sinking, of the individual-self into the community-self that could be imagined.

The absence of competition between engineering manufacturers since the outbreak of war has been mainly, if not entirely, due to the fact that the demand for war material has been more than sufficient to keep all of the old-established works, and many new ones, fully employed. It has, indeed, been an illustration of the fact that competition is entirely controlled by the law of supply and demand. It has been demonstrated by electric power supply undertakings that demand can be created to an almost unlimited extent. Therefore, to reduce or eliminate excessive competition, demand should be developed or increased to balance available sources of supply.

There are millions of British subjects working in overseas territories for the benefit of those who prefer to stay at home, who are just as appreciative of, and equally entitled to enoy, the comforts of modern civilization as those who are already benefiting by these conveniences. The scope for developing a demand for modern engineering appliances in this field alone is practically unlimited.

The need for more perfect co-ordination between individual producers and between producers and distributors is now freely admitted. There are, however, considerable differences of opinion as to whether the centre of such co-ordination or control should be the State, or some private enterprise such as an association of manufacturers, or, alternatively, some independent trading association.

The objection to private enterprise control is that any such undertaking must depend for its existence upon its profit-earning capacity, and where its aims in this direction conflict with the community interests—and there are bound to be many such cases—the latter will be liable to suffer.

On the other hand, the obections to State control are:—

1. Such control would be liable to stultify individual effort, and since the entire fabric of existing British trade supremacy is the outcome of the work of individual firms and persons, it should be the first essential of any scheme of industrial reorganization that individual effort be maintained in a state of maximum efficiency at all costs.

2. State control of any one trade or industry would entail the employment of a very large number of Government officials who would generally know much less about the subject than the principals of the firms they would be endeavoring to control. Moreover, it may be anticipated that the efficient co-ordination of the work of such numerous Government officials would prove to be a greater problem than that of co-ordinating the work of the firms to be controlled.

It appears that actual production, at least, should be left to individual effort, and should be entirely uncontrolled, though a closer co-operation between individual producers, such as is being effected by the various trade associations, and is the aim of the proposed trade parliaments, is undoubtedly to be desired. Some more direct control of distribution appears, however, to be necessary, but whether such control should be by the State or by private enterprise is still an open question. It is possible that some combination of State and private enterprise control may eventually prove to be the best solution.

The ideal to be aimed at is a subconscious co-ordination by indirect influence rather than the despotic mandatory con-

* From Paper Before I. E. E.

rol under defined rules and regulations usually inferred by reference to State control.

A symbolic illustration of such an ideal is afforded by the coupling in parallel of alternating-current generators where the sole controlling or co-ordinating influence is that resulting from the mere connection of the generators to common bus-bars. The generators may be of widely varying capacity, and of greatly differing speeds. They may derive their power, some from steam engines and boilers, or even from motors and secondary batteries. So long, however, as they are all connected to the common bus-bars, each to the several units will supply its quota of power to the demand upon such bus-bars.

To carry this analogy a little further, let it be assumed that the successful paralleling of alternators had hitherto never been achieved, and that every generator in this country was directly connected to a group of consumers whose maximum demand at any time was equivalent to the full-load capacity of the generator. Even though the efficiency of such individual units was the maximum attainable, it is obvious that the inability to take advantage of the improved plant factor, the increased diversity factor, and other economics accruing from parallel running and bulk supply, would result in a combined fuel consumption at least 100 per cent. greater than under existing conditions. Let it also be assumed that the individual unit supply service described is suddenly called upon to meet the competition of a bulk-supply undertaking able to run its generators in parallel. It will be evident that notwithstanding the established connections or goodwill of the individual supply units, the bulk-supply plant will be working under such advantageous conditions that it will rapidly capture all of the demand.

The above analogy represents the conditions under which many British manufacturers, with their individual producing units, were working prior to the war, in competition with the co-ordinated or parallel producing units of the United States and of Germany. The distributing networks of these foreign bulk-supply undertakings were being extended rapidly in every direction, but especially in British Overseas Dominions.

Those who favor State organization of distribution can point to an excellent example of successful indirect State co-ordination of industry in the Government Postal Service (service, not control). Here is no despotic dictatorship—no rules and regulations to control commerce, no interference with individual effort, and yet has there ever been a more potent influence upon the conduct of industry?

If some system of overseas trade service were inaugurated and run by the State, or by State and private enterprise combined, on the same general lines as the postal service, it should be a great boon to all industries. A service of this nature is by no means so impracticable as may at first sight appear.

It must, however, be essentially a public service, and not a trading concern, its first aim being to afford British subjects in all parts of the world facilities for procuring British-made engineering products on satisfactory terms, and its second aim to furnish British producers with the fullest possible information respecting overseas requirements.

Notwithstanding all that has been done in the past to maintain and improve British overseas trade, there is abundant evidence that the results achieved fall very short of possible attainment. For instance, a large amount of machinery and engineering appliances of all descriptions is imported into Canada every year, but it is estimated that less than 5 per cent. of these imports are manufactured in the United Kingdom.

The author's opinion is that maximum efficiency will only be attained by grouping the various elements, upon which successful overseas trade is dependent, under three self-contained, closely allied, and inter-connected sections which may be classified respectively as:—(a) Production, (b) co-ordination, (c) distribution; the suggested co-relation and constitution of these respective sections being shown below.

Production.

The sole aim of those responsible for production should be to manufacture appliances to meet the ascertained requirements of overseas markets (f.o.r. their own works) at minimum prices consistent with reasonable manufacturing profits and a liberal scale of wages to employes. In order that producers may be free to concentrate their entire efforts upon improving the efficiency of production, it should not be necessary for them to devote their attentions to the many intricate problems associated with overseas trade. At the same time, they should be entirely untrammelled by any unnecessary restrictions in the management of their respective businesses in which they, and they alone, are experts.

Co-ordination.

There are at the present time so many organizations devoting their attention to the problems of co-ordinating and reconstructing industry—particularly the engineering trades—that it is difficult to follow and keep in touch with the various projects which are being formulated.

Co-ordination may be defined as the most efficient utilization of all existing and potential factors of production and distribution. To ensure this, it is suggested that each of the several State and private enterprise organizations at present attacking the problems of overseas trade development from different aspects should be represented by one of its members on a central board of service, which board should be the recognized centre for all matters relating to overseas engineering trade. The primary obect of this board should be:—

(a) To provide for adequate representation of all British engineering manufacturers in every overseas market, for which purpose city shipping merchants having established overseas branches should be utilized where possible, and distributing centres under the direct control of the central board should be organized in those overseas territories where no existing channels for British trade exist.

(b) To ensure that every engineering manufacturer in this country shall have an equal opportunity of competing for overseas trade, for which purpose area boards of management—such as have been employed by the Ministry of Munitions for procuring the maximum and economic production of war material—might be utilized as a decentralized purchasing agency for the large variety of engineering requirements for overseas trade.

Very complete information respecting the productive capacity of engineering works throughout the country is already in the possession of the several "Munitions Area Boards of Management" created by the Ministry of Munitions for the purpose of procuring the maximum output of war material. This decentralized system of purchasing engineering products, which has proved to be such a satisfactory method of procuring munitions on an economic basis, should be even more beneficial for the purchase of the large variety of engineering requirements for overseas trade.

Distribution.

To provide for anything approaching efficient distribution of engineering appliances, it is necessary that in every overseas industrial centre a complete distributing organization shall be established consisting of a business general manager, an engineering staff, a number of sub-district salesmen (preferably local men well-known to every potential buyer in the particular department allotted to them), an accountancy and credit department, adequate clerical assistance, warehouse and showroom or exhibition accommodation, etc.

The managers of the respective distributing centres should

be men possessing tact, initiative, judgment and resource, as well as a wide field of general knowledge. They must be given absolute authority to enter into and execute all contracts without reference to headquarters, though they should report to the central board all transactions completed each week.

The engineering staff should consist of men who have been trained in engineering works in this country, and who are consequently familiar with British workshop practice and British standards. They would advise local buyers as to the type of British-made plant best suited to their individual requirements, and would carry out contracts for the erection of complete installations where required to do so.

The sub-district salesmen (or local travellers) would be allotted separate areas to work, of such a size as to enable them to keep in touch with all buyers of engineering appliances in their respective areas. Unlike manufacturers' salesmen, who are rightly expected under all circumstances to push the sale of their own principals' products only, distribution salesmen would be required to report to the local district office all prospects for engineering work of any description. Their sole aim would be to procure the maximum possible turnover in British-made apliances without favouring the products of any individual firm.

A good and trustworthy credit department is an absolutely essential adjunct to every overseas distributing centre. The usual terms of payment in, say, Canada, are 60 days after delivery at purchasers' works, or, alternatively, part payment on delivery and the balance in instalments, frequently extended over very long periods. The local banks invariably discount purchasers' promisory notes, and make collections through their various branches when due. The principal safeguard against bad debts is an efficient credit department. Every wholesale distributor submits all important orders before executing them, to his credit manager, who either knows or has means of ascertaining what is the financial position of every buyer, or prospective buyer, in the territory.

Any attempt to give or control credit from this side is bound to lead to heavy losses through bad debts, or, alternatively, to the loss of a large amount of profitable business.

The pricing and estimating department is possibly the most indispensable section of an overseas distributing centre. Numerous inquiries by mail and telephone, all calling for immediate attention, are received daily, and the conditions to be met are so varied that it is seldom an estimate prepared for one scheme can be used without modification for another inquiry. British manufacturers are frequently recommended to price their catalogues in the currency of the country in which they wish to do business. For engineering work this would usually be of very little, if any, value, since the cost of a plant f.o.b. English port is of no interest to the average overseas purchaser, who invariably requires the cost erected on site—say, 2,000 miles from the coast, and possibly some miles from the nearest railway siding—which cost will amount to from 150 per cent. to 300 per cent., or more, of the f.o.b. cost. Moreover, inquirers invariably call for composite tenders covering appliances made by a number of different firms. Thus a quotation for, say, a pump would usually not be considered unless it also included a petrol engine, suction-gas plant, electric motor, or other means of driving it, with switchgear, sundry pipe work, valves, tanks, etc. Performance specifications and detailed operating costs are also required with each tender.

As very few people in this country appear to have any idea of the cost of running an overseas distributing centre (manufacturers frequently suggest 5 per cent. as an adequate selling commission), the particulars of a year's costs, shown in Table I, actually incurred in one of the industrial centres of Canada, may be of general interest.

Table I.

Rent, rates, taxes, and insurances	£1,205
Salaries, management, engineering, and clerical	2,482
Salaries, salesmen, and travelling expenses	1,793
Packing and delivery charges	764
Office supplies, advertising, legal, and general expenses	572
Bank charges, interest, discount, and exchange	310
Postage, telephone, and telegrams	241
Depreciation and bad debts	396
	£7,763

Total turnover during period covered by above operating costs = £30,013.

Ratio of operating costs to turnover, 25.8 per cent.

Gross profit, £7,012 = 22.4 per cent. of turnover.

An analysis of the above charges appears to show that slightly more than half of the total expenditure is incurred on charges unaffected by turnover, but controlled mainly by the size of the area to be worked, whereas the remaining expenses are approximately proportional to the turnover.

The distributing area in which the results shown in Table I were obtained is known as the Middle West or Prairie Provinces of Canada. It is bounded on the east by the Great Lakes, and on the west by the Rocky Mountains, the chief centre of distribution being the city of Winnipeg. Some particulars of the developed portion of this area, given in Table II, will show how impossible it is to work such a district efficiently without incurring heavy operating expenses.

Table II.

Extreme length of district, E. and W.	Miles.	1,300
Extreme width of district, N. and S.	Miles.	300
Approximate area	Sq. Miles	160,000
Total mileage of railways	Miles.	10,000
Towns having a population of over 500		150
Aggregate population of above towns		770,000
Average population per town		5,000
Number of rural post offices		3,400

Finance.

In endeavouring to compute what capital or financial backing would be required to carry out the overseas engineering trade service proposed, one encounters the difficulty that the engineering industry covers anything from, say, the supply of the smallest electric motor to the equipment of a bulk-supply power scheme or the building of a railway. Whilst the organization, through its overseas distributing staff, would find many opportunities of rendering valuable assistance in connection with heavy engineering schemes, its principal source of revenue would probably be the profits on trading in general engineering merchandise of a kind that would be handled by shipping merchants.

Reference has been made to the desirability of procuring the collaboration of shipping merchants in all markets where such merchants have established distributing branches. The co-operative purchasing, and other features of the proposed central control scheme should greatly increase the previous profits and turnover of these established businesses—on the other hand, their experiences, local knowledge, and trade connection should be invaluable to the central organization. It is suggested that as an inducement to such firms to merge a portion of their increased profits in the co-operative scheme, they should be guaranteed an annual net profit equivalent to the average net profit during the three years prior to the war, and that they should retain in addition one-third of the extra profit earned each year as the result of the larger turnover, and other benefits accruing from their amalgamation with the central organization. The remaining two-thirds of the excess profits would be applied towards meeting the expenses of the central control board.

Commodity Prices and Public Utility Rates

Practically the only commodity universally used by the public of our towns and cities to-day which has not increased tremendously in price is electricity, and with it railway fares. Yet in the face of the universal advance in price, varying anywhere from 25 to 200 per cent., of the simple necessities which enter into the everyday life of the average citizen, the cost of electric current has, if anything, been reduced since the outbreak of war.

It is difficult to understand why this should be the case, and it is open to very grave question if the course we are pursuing in this respect is a wise one. The cost of everything that enters into the production of electricity is greater. Why then should not the product be more costly? The only explanation that can be advanced is that somewhere in the back of our heads we have a remote hope that as soon as the war is over the cost of manufacturing and delivering electricity will be quickly reduced. However, there seems to be very little ground for such a hope. Just as with other products, electricity depends upon the cost of materials and labor and a rapid reduction in either seems unlikely. The logical conclusion, therefore, would seem to be, in fairness not only to the operators, but also to the consumers, that the price of electric current rates and electric railway rates should be in proportion to the added cost of production. This is particularly true in view of the fact just stated, that any readjustment in prices to pre-war levels is more than likely to be a long-drawn-out affair.

An interesting address was delivered recently before the Wisconsin Gas and Electric Association at Milwaukee by W. J. Hagenah. Mr. Hagenah showed that historical precedents proved that the decline of prices from their present high levels will be very slow, even after the war is over. In consequence rate increases should be made now, not only for the duration of the war, but until such time as prices in general shall have become adjusted. An interesting chart was also shown, giving the movement of commodity prices over a hundred years of war and peace. At the present moment the upward trend in the curve is somewhat alarming and this may lead us to hope that the adjustment, to a certain extent at least, may be rather more rapid than in past history. The following extracts from Mr. Hagenah's address are very much to the point:

We are witnessing at the present time a most important development growing out of our disturbed economic and political conditions—one which is destined to have a most far-reaching effect on the operations of public utilities. Economists have for some time foreseen and predicted the condition which is now exerting such tremendous pressure on every form of activity, individual as well as corporate and public as well as private. There is hardly an individual or an enterprise that has not already felt this staggering force or is not destined to feel it in the near future, but among all forms of industry which are staggering to effect a readjustment none has suffered so acutely as have the public utilities. I refer to the steadily rising level of prices, to which such decided impetus has been given by our entry into the great European war.

For over fifteen years before the opening of the European war we witnessed in this country a gradually increasing price level. Coincident with this was our great industrial and commercial development.

The mine owner, the manufacturer, the farmer, the tradesman and the professional man met the rising level of prices by shifting the burden through increased charges for their product or his service, but not so with the utility. Its rates were fixed and could not be increased except by action of the proper public authority. So long, however, as the utility has not yet reached the reasonable limit of its technical development and while the territory which it served was still far from saturation, these increasing costs were largely offset by improvements in apparatus and methods. In fact, there are many instances where in spite of these conditions net earnings, because of especially favorable local conditions, showed annual increases. Electric production units were each year becoming larger and more efficient. The art of distribution and transmission was making great strides. The investment per unit of capacity generally tended downward. At the same time the demand for utility service was growing, and what fifteen years ago was considered a luxury in a short time became a necessity. As long as this condition was present the economies growing out of increased efficiency and service development tended to offset the rise in labor and material prices, but when relatively high efficiency had been realized and the increases in the price level appeared to be gaining in momentum, the trend of net earnings in most instances turned definitely downward. With the reasonable limit of expansion reached, the crisis in the history of the utility industry approached. Between the pressure of increasing costs and the declining purchasing power of the dollar of income net earnings were threatened with extinction. This, in brief, was the condition of the utility industry when in 1914 the storm of the European war burst on the world—a war which each year has enveloped additional peoples and has gained in fury and destructiveness. And with the coming of this war the level of prices, which was already at the highest point reached in a generation, turned abruptly and violently upward. which tendency it has maintained to this time.

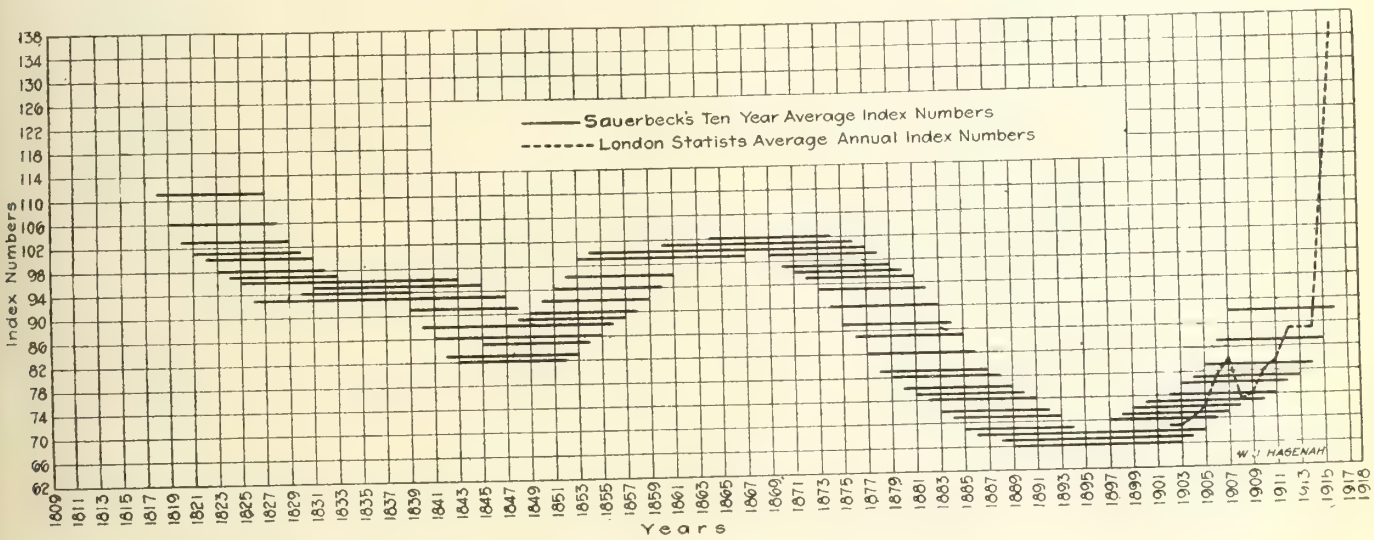
Commodity Prices That Go Back a Hundred Years.

The diagram reproduced with this article shows Sauerbeck's ten-year average index prices for the years from 1817 to 1916, on which I have superimposed the annual index prices of the London **Statist** in order to show what has taken place beyond the period covered by the Sauerbeck data and what the extension of the Sauerbeck data for the next few years will reveal.

Just as the political history of the nineteenth century dates from the Congress of Vienna and the final defeat of Napoleon, so the economic history of that century also begins with the conditions then broadly recorded. The year 1815 is one of those years in history which marks an epoch and the influences of which time extend for many decades. In the next few years we are likely to witness another such epoch-making date, when the world, bled white by war, will close a chapter of great social and economic forces in conflict, in the soil of which mighty political movements will have taken root.

Let me call attention to the fact that from the high-price level following the Napoleonic wars to the high level of the Civil War period was approximately fifty years. Also, following the low point reached in about 1846, it was again fifty years before the low level after the civil war was reached. Singularly, it is now just fifty years since the high level of prices in the Civil War period. In view of these events of the last century, covering two complete major economic cycles, in each case growing out of conditions similar to those with which the world is confronted at this time, can it be expect-

ed that following the declaration of peace in this war we shall see a quick decline in prices to the pre-war level or lower?



Prevailing Prosperity is Largely Fallacious.

In spite of prevailing conditions, we appear very prosperous at this time, but let us not be deceived. This is a war prosperity, and both England and Germany report the same kind of business activity. However, in view of what we know of conditions, it would be more correct to say that we are extremely busy rather than extremely prosperous, since we are not creating wealth. Our country, along with almost the entire world, is just now engaged under pressure of the greatest necessity in carrying on campaigns which are exhausting the man power and wealth of the world and from which all will emerge as peoples much poorer than before they entered. From this period of intense activity, of strained production and increasing consumption, we shall enter a period after the war when this destruction must be paid for by the hard labor and economics of the people. The reaction will be as great as was the action, but it will be extended over a much longer period of time. This does not mean that we shall at once have a serious depression. On the contrary, the necessity for urgent reconstruction and the accumulation of deferred work, will lead to considerable activity for a year or turn of peace, will lead to considerable activity for a year or more after the close of the war; but the period of readjustment and of producing from the soil and other natural resources and by hard labor the wealth to pay for these struggles will cover many years, and during this time we shall undoubtedly experience a relatively high level of prices, but with a gradually declining tendency the world over.

Based on the course of the price movement after periods of great world wars in the past and in view of the special conditions with respect to the currency and banking systems at the present time, we may look forward to a considerable period of high prices, a period of business readjustment and a period of new social legislation. What this means in its full significance to individuals, to business in general, and especially to public utilities, can be readily understood without attempt on my part either to generalize or to go into details.

However, reflect on what it will mean to business to be required to make extensions and to finance requirements on this level of prices while operating under a rate schedule determined five years ago if we should not return for fifteen or twenty years to the price level on which such rate schedule was based. What will it mean to business to have to purchase operating supplies on the price level of five years ago? The price level under which plants were built, under which franchise obligations were established and on which rate schedules were established may not again be reached in fifteen years or even longer. There are some who say that prices will decline quickly with the return of peace. Whether they will or not no one definitely knows, but when we stop to consider the extent and destructiveness of this world-wide war and remember the price movement after each of the other two great wars, it is not difficult to believe that many men in this room will not live to see the return to the price level of 1914.

As a result of this violent price movement which we are now witnessing the work of the utility commissions has not only been enormously increased but the character of their decisions reflects the really constructive purpose of such institutions. During the decade of commission activity extending from 1907 to 1917 the almost universal results of commission investigations were reductions in rates. For the larger part of this period the rise in prices was gradual but extremely moderate in comparison with the last two years; but these increases were in many instances offset by the increased efficiency in utility operations and the great extension in service. So elastic was the industry and so quick its response to reasonable rate reduction that these years, which represent an almost unbroken record of rate reductions, at the same time mark the golden years of utility growth—years during which public utilities reached a point of growth in size and stability comparing favorably with the greatest industries of history.

The movement of commodity prices in 100 years of war and peace.

At the present time, however, the commissions, which were quick to take advantage for the public of every economy in operation or profit resulting from improvements, are now foremost in granting relief from the pressure of high prices. Nearly five hundred public utilities have received increases in rates or have been relieved from burdensome obligations by state utility commissions and by city councils within the last fifteen months, and among this number are companies operating in many of the large centers of population. If the present tendency among state commissions and city councils to permit increases in rates to offset rising costs continues, the year 1918 will witness a practical cancellation of much of the work for rate reduction accomplished by these same authorities after many years of labor. It will also show that the original conception of a public utility commission as a continuing investigating body created to do justice to investor and public alike was correct, and that even in the midst of this great war, wherein every element of our national life is strained to the utmost, the desire for justice and fair play to all interests is still firmly grounded in the heart and mind of the public.

Electric Railways

Winnipeg Electric Railway Company Remodelling Their Entire Rolling Stock

The remodelling of the entire rolling stock of the Winnipeg Electric Railway Company, which has been under way for some time in accordance with an agreement entered into with the city in the latter part of April of this year is being proceeded with rapidly in the company shops at Fort Rouge. The entire work is under the supervision of T. L. Robinson, a young mechanical engineer of wide experience, and at the present time the remodelled cars are being turned out at the rate of six per month. While the remodelled cars are those that have been in the service for some time, the extent of the changes and modifications is such that when finished they present almost a new appearance.

The terms of the agreement state that the company in the remodelling of the rolling stock must make the cars modern in every respect. Front exits, improved lighting and route signs, removal of running boards and installation of folding steps are among the innovations called for. The folding steps manufactured by the McGuire-Cummings Co., of Chicago, have been adopted as a standard, and the lighting fixtures of the Safety Car Heating and Lighting Company will be used throughout.

The front exits will be on the same scale as the rear ones, only on a smaller plan. One 2-leaf folding door to fold out and back, to be controlled by the motorman, will be installed, with which will be operated a folding step provided with anti-slip tread and kick plate. In the right hand vestibule window an illuminated sign box of the Keystone type will be placed. A removable winter-proof partition for the motorman between the bulkhead exit and the vestibule door, glazed to allow motorman full view of exit door and step and provided with door for motorman, is a feature.

The interior lighting arrangements call for five shaded lights to be placed in the centre of monitor deck through selector switch on rear platform, sixth light to be on rear platform over conductor's position. Keystone illuminated side window signs will be installed in each rear window.

The rear bulkhead is to be installed with swinging door, on left side full panelling and sash in centre so arranged to care for sliding door to be installed on right hand side, swing door arranged to swing in and towards side of car. Sliding door at exit side to close toward body post. Centre double dash arranged to allow conductor to make announcements without opening doors.

The changes in the rear platform call for the installation of two 2-leaf folding doors in vestibule opening, rear set to fold out and back and front set to fold out and towards body. Rear half of vestibule opening is to be used for entrance and the folding step is to work in conjunction with the folding door. The first half of the vestibule opening is to be used for an exit and each door is to be separately controlled, the controlling handles to be mounted on rail near conductor. A protective compartment for the conductor is provided for with heater, raised floor and a seat.

A new fender type, similar to that in use, will be adopted, and the present trucks and motors will be removed. New or rebuilt ones will take their place. The new type of truck called for will be provided with 26-inch wheels with axles for G.E. 258 C motor or equivalent, and having 3¾ x 7 journals. The present brake quipment and rigging will be modified to work efficiently with the new truck and motor equipment. The bolster will be modified to allow the use of roller side bearings which will be installed. The remaining present electrical equipment will be modified to meet requirements of new motor equipment.

Twenty-five end entrance p.a.y.e. double truck trailer cars will be built. The cars will be 41 feet in length and have a seating capacity of 48. They will be patterned after the same style as the remodelled cars and will be equipped with two baby motors and straight air brake equipment with emergency feature. Folding doors and stops are called for and six shaded lights in the body and two in each vestibule will be installed. The route signs will be of the same pattern as the remodelled cars.

The open cars for summer use with the side running boards are also slated for treatment. The running boards will be eliminated and a centre aisle cut through. Only open cars are in use.

Greater Use of Electric Railways to Relieve Traffic Congestion

Following a campaign of publicity in connection with the value of motor trucks for relieving the traffic congestion at various large centres on this continent, the Electric Railway Journal has taken up the case for the electric railways, and maintains that these are not being used to their fullest capacity. Of course, in the United States the system of electric railways is much more complete and covers much wider areas than is true of Canada, but it is doubtful if the possiblities of our own electric railways for carrying freight have been sufficiently considered. It is easily believable that much relief could be given in a number of cities by the use of these lines, if not during the day-time at least from midnight till early morning when the passenger traffic is negligible.

It is true very few of the franchises of the Canadian street railway systems admit of carrying freight, but if it can be shown that the present congestion can be relieved in any way, there should be no difficulty whatever in having this restriction removed. In addition, it would probably add somewhat to the revenue of the street railway companies, which are so sadly depleted at the present time, owing to the fact that the cost of operation and maintenance is much greater than formerly, while the fare remains in almost every case the same.

There is no more anomalous condition existing to-day on this continent than the fact that the average street railway is still selling transportation at 5 cents a head or less, just as it was five, ten or fifteen years ago, when the price of everything else the man on the street buys has increased in value from 50 per cent. up. The result of course is that very few, if

any, of our electric railway systems are paying expenses, which means again that the tracks are being worn out and the rolling stock becoming dilapidated, to say nothing of necessary extension work being at a standstill. Unless something is done immediately to remedy this condition, it seems inevitable that many of the railway systems of Canada will be bankrupt and cease operations. All through the United States and in a few isolated cases in Canada, this situation has been realized and fares have been raised. For example, in Edmonton, a municipally operated system, the rate has just been raised to 7 cents for cash fares. Indeed the tendency appears to be to allow the municipally owned lines to make these increases, while at the same time, private companies operating under franchises are being held strictly to the franchise rate. However, there is no getting away from the unwritten law that the public gets exactly what it pays for, and if the rate at Vancouver, Montreal, Toronto and other cities, is held at 5 cents or less, just that much service will inevitably be supplied to the people who ride. When this condition becomes intolerable, the operation of the systems must cease.

In the article referred to above, a number of conclusions were drawn from the arguments presented. These are applicable to Canada, possibly, in less degree than in the United States, but nevertheless are of sufficient interest to quote:

Conclusions.

1. From a purely economic standpoint, existing electric railway facilities should be used to their fullest capacity before the development of any other type of freight transportation is attempted.

2. The investment in electric railway systems of the present day is so great that it would be most uneconomical practically to disregard a highly developed system of transportation service such as electric railways can render under present conditions.

3. Many interurbans are handling traffic which is commensurate with that of steam railroad service, and where facilities exist they are in a position to handle practically all short-haul traffic in their respective territories.

4. Federal asistance to the electric railways by supplying cars, improving physical alignment and freight terminal facilities would place the interurban railways in a position to handle a large percentage of the short-haul freight which is now congesting the steam railways.

5. Furthermore, the expenditure required to place the electric railways in the condition above mentioned, would not amount to one-tenth of that which would be needed for the extension of motor-truck freight haulage in the same territory now being agitated.

The article concludes as follows: Therefore, immediate relief can be secured for the steam railroads through assistance from an existing facility which only needs proper fostering to become immediately an important factor in our national emergency and for the future. In order to effect this, there should be universal interchange of freight rolling stock between steam and electric lines that can handle steam rolling stock, and federal financial aid to those electric lines that would be able to do so with the proper assistance.

For the year 1917 the gross earnings of the Calgary Power Co., Ltd., totalled $262,161 against $266,982 a year ago. Operating expenses at $40,059, however, compare with $49,923 a year ago, leaving net earnings at $221,202, against $217,058, in 1916. The net profit for the year after payment of interest charges was $71,212, against $65,209. From the year's surplus $35,000 was appropriated for depreciation, leaving the net balance in profit and loss account $143,947, against $107,735 in 1916.

Conductorettes in Kingston

The Kingston, Portsmouth & Cataraqui Electric Railway Company, Kingston, Ont., have been employing six women conductors for the last six months and three more have been trained to act as "spares." Mr. Hugh C. Nickle, general superintendent, advises that the "conductorettes" have been most satisfactory and that the travelling public are well pleased. The women are not required to operate

switches, this being done by the motormen. They do, however, operate the interlocking system where the street car line crosses a steam line. Our illustration shows the winter uniform worn. It is the intention of the company to provide a regular uniform which will likely be of tan color in order that dust will not show unduly. The male employees of the company have made no protest against the employment of women.

Motor Busses in Winnipeg

The Winnipeg Electric Railway Company is now operating four motor busses in a section of the city which is not served by the street railway lines in accordance with the agreement entered into with the city last spring that the street car service in outlying districts must be supplemented by motor busses until the trolley lines were projected in that area. The service is very satisfactory from the public standpoint and as there are only three busses in operation at one time, one is kept for emergency use should a breakdown occur.

The busses, which were illustrated in our issue of April

[illegible] the standard one-ton 16-passenger type, manufactured by the Studebaker Corporation, and embody all the details laid down in the detailed specifications provided for this style of car. The busses are finished in gun metal with an ivory stripe, weigh 3,700 pounds and cost $2,295 f.o.b. Walkerville.

The specifications of the busses are as follows: wheel base, 125 ins.; frame of pressed steel channel section 5 x 3 x 3/16 in.; width 36 ins.; length 186 ins. overall; transmission—selective type mounted on rear axle, 3 speeds forward and reverse; gear ratios—1st, 18.2:1; 2nd, 10:1; 3rd, 5:1; reverse, 23.7-8:1. Equipped with Timken roller bearings. Aluminum transmission case. Propeller shaft equipped at either end with universal joints, tubular 1⅝ in. 3/16 in. wall. Axles—front axle, forged L-beam section. Rear axle, full floating, equipped with Timken roller bearings. Cast steel axle housing. Axle shafts, 1⅜ in. in diameter. Chrome nickel steel. Radius rods. Drive is through radius rods. Torque arm—pressed steel channel section firmly bolted to transmission case and secured in axle housing by forged braces. Springs—semi-elleptic in front, semi-elleptic in rear. Spring centres—front, 37-11/16 in., 2 in. wide; rear 51 in., 2½ in. wide. Steering gear—left hand drive, 18 in. steering wheel, irreversible worm and gear. Spark and throttle control—Hand control on steering wheel, carburetor accelerator operated by foot. Wheels—wood, artillery type, 12 spokes. Heavily constructed for truck purposes. Brake drums securely bolted to spokes. All wheels equipped with Timken bearings. Tires—Dominion plain tread tires in front, 35 x 5 pneumatic. Safety tread tires in rear, 35 x 5 pneumatic. Clutch—cone type faced with woven wire asbestos material. Clutch pedal mechanism connected to ball thrust bearing on propeller shaft for shifting clutch. Pedal adjustable. Brakes—emergency, expanding band type; service, contracting band type. Brake bands faced with woven wire asbestos material 2 ins. wide, acting on 15-in. brake drum. Brake rods equipped with equalizer beams. Brake pedal adjustable. Hand control—centre control. Lamps—electric dash lamp, tail lamp and head lamps (the latter provided with dimmer switch).

Quebec Railway Fare Increases

The Quebec City Council has authorized the Quebec Railway, Light, Heat & Power Company to increase its street railway fares. The new rate is a straight 5c fare, (instead of 6 tickets for 25c), five tickets for 25c or 21 for a dollar. The workmen's tickets are to be 8 for 25c, and are good between 6 a.m. and 8 a.m. and 5 and 7 p.m. Children's fares are 3c each or 10 tickets for 25c. The question of extensions in the outlying wards came before the Council, but the Company pointed out that it was impossible to obtain the necessary rails, and as soon as those could be secured work would be commenced.

New Electric Traction Book

Electric Traction—By A. T. Dover, Lecturer on Electric Traction at the Battersea Polytechnic, London; Whittaker & Company, London and New York, publishers; price $6.00. This book is a treatise on the application of electric power to tramways and railways and is intended for engineers and advanced students. Representative examples of modern tramway and railway practice are included, but discussions on generating stations and transmission lines, as being a specialized subject, are omitted. The subject matter has been arranged as follows: Mechanics of train movement; motors; control; auxiliary apparatus; rolling stock; detailed study of train movement; track and overhead construction; distributing systems and sub-stations. A number of worked examples have been included in the text. The scope of the work may be gathered from the following chapter headings: Mechanics of Train Movement; Continuous-Current Traction Motors; Single-phase Traction Motors; Polyphase Traction Motors; The Testing of Traction Motors; The Control of Continuous-Current Railway Motors; The Control of Single-Phase Railway Motors; The Control of Three-Phase Railway Motors; The Control of Continuous-Current and Alternating-Current Motors for Regenerative Braking; Auxiliary Electrical Equipment for Tramcars; Auxiliary Electrical Equipment for Electric Locomotives and Motor-Coaches; Rolling Stock for Electric Tramways; Rolling Stock for Electric Railways (Motor-Coach Trains); Electric Locomotives; Train Resistance; The Calculation of Speed-Time Curves and Energy Consumption for Electric Trains; Tramway Track Construction; Track Construction for Conduit Tramways; The Tramway Track Considered as an Electrical Conductor; Conductor Rails and Track-Work for Electric Railways; Overhead Construction for Tramways; Overhead Construction on Railways; Feeding and Distributing Systems for Tramways and Railways; Sub-Station Converting Machinery and Switchgear for Continuous-Current Tramways and Railways. There are 518 illustrations and 5 folding plates; 667 pages. There is also a long list of 33 tables.

Mr. Kelsch is Vice-president

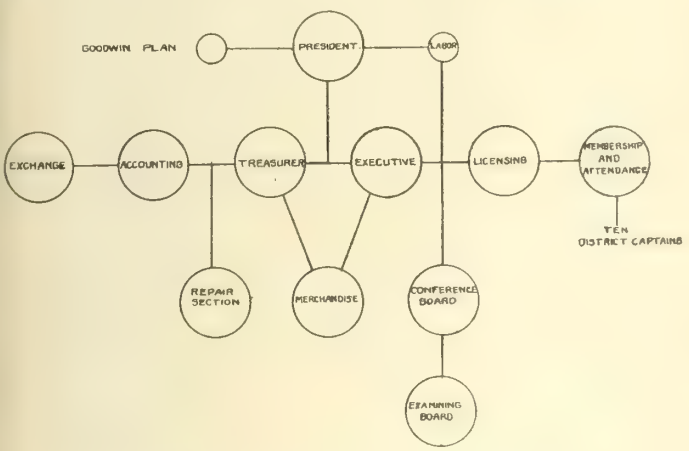
Mr. R. S. Kelsch, consulting engineer, of Montreal, has been elected vice-president of the American Institute of Electrical Engineers. The election was by letter ballot.

The American Institute of Electrical Engineers will hold their annual convention in Atlantic City, N.J., on June 26-27-28.

Mr. R. S. Kelsch.

C.E.A. Will Hold One-day Convention

The secretary of the Canadian Electrical Association has sent out notices that the 28th annual convention of the Association will be held at the Chateau Laurier, Ottawa, on Friday, June 21. The announcement states that as this is a war-time convention no entertainment will be provided and the matters discussed will be principally confined to the effect of the war on the central station industry. It is specially urged that there should be a full attendance of members.



The Dealer and Contractor

Toronto Electrical Contractors Transact Much Business at Last Meeting of the Season

The last meeting and dinner of the season was held by the Toronto Electrical Contractors' Association in the Board of Trade dining room on Thursday evening, June 6. There was a good attendance and a very satisfactory representation of manufacturers and wholesalers.

President MacIntyre reported that he had sent out requests to the various manufacturers that they co-operate with the association in having their discount sheets made of such a size and punching as to fit into the association members' filing cases. A number of favorable replies had been received and in one case a proper size discount sheet had already been received.

The discussion centered chiefly around the form of organization of the association. The chairman outlined the plan that had been drawn up by the executive and which is reproduced herewith. From this it will be seen that the president confines his attention chiefly to the Goodwin plan of reorganization and to the labor committee, of which he is chairman. Along with him on the labor committee there is a

Organization plan of Toronto Electrical Contractors.

conference board of three members and an examining board of two members. The conference board includes Messrs. E. C. Clarke, G. E. Davenport, Kenneth A. MacIntyre, (chairman). Messrs. Harry Rohlader and Dan Robson comprise the examining committee.

Mr. Harry Hicks, vice-president of the association, is to have charge of the exchange sheet. This is a little publication which deals with materials, motors, etc., which the members of the association may buy and sell among themselves. Mr. Geo. Matthews, and one other member to be elected, were named on this committee. Mr. E. F. W. Salisbury, secretary of the association, becomes chairman of the accounting committee. Mr. Geo. T. Dale is chairman of the repair section and Messrs. J. Everard Myers, treasurer of the association, R. A. L. Gray and Geo. J. Beattie, (chairman), are on the merchandising committee, and will concern themselves with the issue of price sheets regarding materials, labor, etc. Mr. E. A. Drury becomes chairman of the licensing committee with members to be elected. Mr. Harry Rooks is chairman of the membership and attendance committee and under him will be ten captains, each having charge of a district, as already outlined.

A resolution was passed commending the work of the Compensation Board. During the year the rate has been reduced approximately 25 per cent. The secretary was instructed to write the Board expressing their appreciation of the manner in which the association members have been treated.

The Code of Ethics of the National Association was read and discussed and adopted unanimously by the members.

One of the most important items was the decision to take steps towards affiliation with the National Association of Electrical Contractors of the United States. The president was particularly insistent in this case that each member should be given an opportunity of expressing his views and there was no opposition.

The scale of fees, as worked out by the executive, will be according to the yearly business turnover and will likely be as follows: Up to $12,000, $20 a year; $12,000 to $25,000, $30 a year; $25,000 to $50,000, $40 a year; $50,000 to $100,000, $60 a year; $100,000 to $150,000, $90 a year; $150,000 to $200,000, $120 a year.

A number of members expressed their intention of going to Cleveland to attend the annual convention of the National Association, July 17—20, these being Messrs. Salisbury, MacIntyre, Clarke, Gray, Myers, Hicks, Drury, and Rooks.

A pleasing feature of the proceedings was the presentation of a substantial cheque to Mr. Geo. T. Cross, Mr. J. Everard Myers' assistant, who has given so freely of his time, energy and ability to the association during the past year.

133 Ranges Per Month

In the Electrical News of April 15 we described the successful campaign the City Light and Power Department of Winnipeg had put on to increase the sale and use of electric appliances. At that time Mr. R. A. Sara, sales manager, stated that they were inaugurating an electric range campaign and described its organization briefly in the article.

We are just in receipt of a further note from Mr. Sara stating that the electric range campaign resulted in the sale of 133 electric ranges in the city during April. He had anticipated that the May sales would be equally satisfactory but the strike then under way in Winnipeg would probably interfere.

A resolution extending the authority of the United States Secretary of War to grant permits for water-power diversion at Niagara Falls has been adopted by the Senate. An amendment to repeal the law prohibiting power companies from installing new machinery was defeated.

Electric Plants in Country and Farm Homes

The Farmers are Ready to Buy and Only Need to be Convinced— The Electrical Contractor is the Logical Salesman

The importance of farm lighting plants is again illustrated by the fact that Electrical Merchandising, in its May issue, has given over practically the whole of its space to a description of the various phases of this interesting subject—The value of the plant to the farmer; methods of convincing him that he needs it; what is the best type of man to sell it; the attitude of the farmer's wife on the question; the matter of profits; and so on. One of the most interesting articles is by Mr. L. C. Spake, who writes on the question of teaching men how to sell farm lighting plants. Mr. Spake says the farmer is going to buy lighting plants. Everybody in the electrical and inter-allied farm-lighting plant fields believes that. The open question is: **Who will sell him those plants?**

The chap who is distributing through the electrical trade says it will be the electrical dealer. The fellow with a bunch of specialty men as distributors says it will be a specialty man. Both answers may be all right for the immediate present, but in the near future, it seems pretty plain, the fellows who will get the farm-lighting plant business will be men who are combination dealers and specialty salesmen.

The manufacturers' sales-policy problem therefore simmers down to whether to hire specialty salesmen as distributors and try to educate them to be dealers as well, or to enlist the aid of established electrical dealers and try to train them or some of their men to become specialty salesmen.

There is absolutely no reason why both of the plans mentioned above will not work—with the net result that the electrical trade will be the gainer to the extent of acquiring several thousand better retail merchants.

The farm-lighting plant manufacturers who realize this—and most of them do—are getting busy on their program of dealer education. There is a particularly interesting development along this line in the group which is teaching dealers to sell farm-lighting plants. Take as an example, the activities of L. C. (Jack) Marron, whom all electrical dealers know as a fellow contractor and retailer. Mr. Marron has gone into the farm-lighting and power plant manufacture business. In addition to being an electrical dealer, he was formerly a Delco agent. He has sold plants of other makes as well as his own.

From the experience he gained in this work he has dug up facts and information to help show his own dealers how to sell. He contends that the fundamentals of the plan are applicable to any worth-while line of plants. What he has learned is of real value to the electrical man who contemplates hiring one man or a whole force of men to sell plants for him. When he was asked what he taught his dealers he replied:

"When we hire a man to sell plants to farmers we assume that that man at the beginning is 90 per cent. legs and 10 per cent head. We try hard to change the proportion by intensive education. When he arrives at a point where he appears to be 50-50 on legs and brains we give him a car to take him to places where his head can work—on the farmers. Up until that time he walks."

How "intensive education" means a lot more than those two words convey. Here is what a man has to learn.

Price and Terms His Opener.

The first time he approaches a prospect he is under absolute instructions to get the following information off his chest.

"My name is Bailey. I represent the Marron Manufacturing Company. I think I have the best farm-lighting plant that has been offered to the farmer. I believe I can prove it to you. This plant sells for $585 f.o.b. factory including battery. You build the foundation. We set up the plant and hook it up to your wiring and start it off for you. It is shipped bill of lading attached, a check for $25 accompanying the order."

The salesman as an opener has told his price and terms of sale! An unheard of process of selling, you will remark. And so did I. But here is the way Mr. Marron explains explains the logic of the plan:

"Suppose, for example," said he, "a salesman spends half an hour getting a farmer all worked up telling what a whale of a plant he has to offer. He talks about excellence of mechanical features, the guarantees, etc. During this time the farmer, who knows very little about what electrical machinery costs, begins to form an idea of what the selling price really is. His idea is usually about one-half too low—especially if the plant in question is a so-called high-priced plant. Then when the price is stated at the end of the conversation the farmer throws a fit, throws up his hands, and more than likely throws the agent off his place. In any event the agent has to start all over again.

Farmer Can See a $1,000-Value.

"On the other hand if the farmer has been told the price and terms at the outset the agent has prevented the prospect from making up his mind in advance to something which is not true. Then things can proceed on a sound business basis. There need be no fear in proposing a $1,000 proposition to a farmer. He is no piker. He has spent big money for machinery and equipment before and he can see a $1,000 proposition just as clearly as anyone if the seller has $1,000 worth of real value to offer."

When the prospective salesman has learned this much of his lesson he next tackles the mechanical features of the plant. He is given complete technical information on the engine, generator, switchboard and battery. For forty-eight hours he is supposed to devote real study to this literature. When he thinks he has mastered it he comes back for an examination. And it is some examination. "What is the piston made of? Describe the features of our ingenious oiling system. Tell how the laminated pole pieces of our generator are made." Those are some of the questions the salesman must answer to qualify.

Technical Detail Helps Explain Cost of Manufacture.

It may seem foolish to some to go into such intricate technical detail, but it is contended by farm-lighting manufacturers that the farmer is a "bug" for that sort of dope. He understands machinery in a general way and later in the sales talk when he wants to know why the plant costs so much, it is very effective to be able to point out the many minute and obviously costly operations that go, for instance, into the manufacture of a laminated pole piece. Moreover the farmer studies all farm-lighting plant sales literature and is better versed technically than might be imagined. So it pays to know and to talk some of the mechanical features.

The same idea applies to the battery. The agent is taught to state that the plant is sold preferably with a battery which

is positively guaranteed for five years. That always gets a rise out of the farmer who has had the sad experience of renewing his automobile battery at the end of one or two years, and most farmers have had that experience once or twice. The agent is even taught the details of construction of the battery so that he can actually convince the farmer that there is no "nigger in the woodpile" in that five-year guarantee.

Now all this sounds as if the plan was to "feed up" the farmer on nothing but "technical dope." But, not so. The agents are advised against talking technicalities more than twenty minutes. Then comes the "heart-interest stuff," so called. In reality it is not so much the sob-sister sort of story as it is just getting down to a sensible discussion of the farmer's home problem—in the farmer's own language. An average agent's talk runs like this:

Discussing the Farmer's Home Problems.

"Why, man, you ought to modernize your home like the city man. Even if you had a mortgage on the place that should make no difference. The salaried man in the city at $100 a month building a cottage out of Building & Loan funds would not think of doing without electric light. If you are not as progressive as he, how do you expect to compete with the city for the interest of your boys and girls? You want them to stay at home, don't you? But even at that it is really not a question of spending money. Buying a farm-lighting plant is really making an investment at 20 per cent. interest. As for the use you will get out of it, there is no comparison between it and your other equipment. You use your corn planter ten days each year, your binder seventeen days, your corn plow thirty days, your tractor fifty-six days and your automobile not more than 100 days a year. A farm-lighting and power plant is used 365 days a year."

The farmer usually recognizes the correctness of the average days' use of his equipment as quoted, but that "20 per cent investment" figure so casually thrown into the conversation loks questionable and interesting. To the farmer who is looking for a reason for not signing up, it looks like a chance to "trip up" this smooth agent. So he says "How do you figure that 20 per cent investment? How is a farm-lighting plant going to make me any money "

"The answer to that is easy," replies the agent, getting out his pencil. "'Now, your wife spends a weary half hour every day at the dirty work of cleaning lamps. That's three hours a week. She will admit (and I can see by looking at her clean house) that she spends two hours a week sweeping. Running the cream separator takes fifteen minutes a day or one and three-quarter hours a week. Some one has to spend fifteen minutes a day, or another one and three-quarters hours a week, pumping water and that is darned hard work. Churning takes an hour a week and the electric way produces more even churning than the hand process. Cracked feed goes farther than whole grain when fed to chickens and stock, and a light and power plant will save at least a half-hour a week from this job, in addition to reducing grain consumption."

In this way the agent runs through the farm duties in which there is a real opportunity to save time.

Reducing to Dollars and Cents the Savings Effected.

Then the agent continues: "I suppose you pay your hired man $50 a month and have to feed his horse. His total cost to you is around $75 a month. Say it is 35 cents an hour. (The farmer will admit this is conservative nowadays.) Your wife's time and your time is surely worth as much as that of your hired hands. And even if we go no further with the time-saving study than those items already mentioned we have a saving of ten hours a week or an annual saving of $182. In fact it would be easy to show how in time-saving alone the plant will nearly pay for itself in one or two years."

This sort of argument interests the farmer's wife who is usually "in on" the conversation. So does the "comfort" talk. The farmer is usually busiest in the heat of the summer, and it does not take much imagination to draw a picture of the solace of an electric fan on a hot summer evening. The pleasures of ironing on the porch instead of in the sweltering kitchen is another easy point to make. Plants have been sold on the argument that electric light relieves eyestrain and increases the ease with which children study. If any of the family wear glasses, this is a very strong point to emphasize in view of the supporting fact that city schools now examine the eyes of children and recommend glasses in many cases to increase their efficiency as students.

Closing the Sale Requires Tact and Persistence.

When things get along this far the farmer is usually not looking for a reason not to buy but he is certainly anxious to locate a reason for not signing the order to-day. The talk drifts to the cost of house wiring. A unit system figuring easily disposes of the wiring material and labor. Fixture selling has also been reduced to what is practically a Sears-Roebuck plan. On 100 loose leaves in a folder, different types and styles are shown and on the same sheet each fixture is fully described in glowing language.

Any one can read it to the prospect. It is written so that it sounds good—it sounds just as a real fixture merchant might say it. No real knowledge of fixtures on the part of the salesman is therefore necessary, according to the plan. A choice is made and the remainder of the loose leaves—except those showing one or two appliances, which the agents intend to figure in—are stowed away. The complete bill is figured and is quoted to the farmer in a lump sum.

In preference to quoting in the form of an itemized bill this method of quoting a lump sum is very strongly recommended. It leaves no room for haggling over details or for small eliminations from the order to effect a price reduction. When this price is quoted, added to the price of the plant, the sale is then down to the "closing point" where it seems that a large degree of persistence on the part of the agent is one of the largest determining factors.

The foregoing are some of the things Mr. Marron believes in teaching his agents. He also believes that the electrical contractors could well afford to hire salesmen and teach them these things. The smaller contractor-dealer is generally so busy himself that he has little real time to devote to farm-lighting plant sales. In consequence he is sometimes wont to put off starting his campaign "until next week when he has more time." Next week never comes. So the really progressive dealer hires salesmen and puts them to work on the job. As a piece of good advice on hiring these men Mr. Marron said, "Hire only the man who is willing to and able to finance himself for thirty days. If he cannot do that he is no success and the chances are he never will be." Experience shows that nearly all Mr. Marron's agents sold a plant within two weeks. Even those who did not finally make good succeeded in this. So the thirty-day financing need have no terrors to a man who is a real specialty salesman.

The real big message from Mr. Marron to his contractor-dealer friends, however, is: "Get into the game. Some one is going to make real money out of it. And that man will make most money who knows best how to teach men to sell farm-lighting plants."

Duncan Bond, Denver, Colorado, has joined the sales force of The Packard Electric Company, Warren, Ohio. Having been brought up in the west, Mr. Bond will look after the business of the Company in that section where he has won the enviable title of "Electrical Wizard of the West." He will be a strong addition to the Packard organization. It is said that the company is building some very large transformers for western interests.

Methods of Computing Overhead Expenses of Electrical Contractors*

Many articles that have appeared in the trade papers regarding overhead expense do not seem to cover the field fully and I do not pretend to be able to add anything to the volume of literature already published on the subject, but I promised to start the discussion, and believe if we each contribute some of our own experience we can apply the fruits of some of these articles to our local conditions.

No feature of our business is more important to the contractor or business getter than the subject of overhead expense. Most of us know too little about this at the beginning of the year and too much about it at the end of the year; and our present problem is to take the experience we get at the end of the year and use it at the beginning of the year, or when we are planning our business-getting campaign. No contractor should be satisfied with breaking even when managing an independent business. He should not be satisfied in making the same money that he would make if he were working for some one else on a salary. A contractor who does not make a profit above his salary would better close out his own business and take a position working for one of his competitors. In this way he will save gray hairs and worry, get more satisfaction and comfort out of life, be just as far ahead financially and have time and leisure to devote to the cultural things of life.

Overhead Expenses Same for All

We have it on no less authority than that of Mr. Goodwin, who made the statement in the Hotel Wisconsin at our January convention, that the larger contractor has a larger percentage of overhead than the smaller contractor. This I doubt very much. I do not believe there is any very great variation. I do believe, however, that overhead expense today is very much greater than it was a few years ago. Overhead expense should cover all such items as rent, telephone, manager's salary, insurance, postage, printing, automobile maintenance, office salaries, advertising, superintendents' salaries, interest, legal expenses, and the proper allowance for bad accounts and for breakage or loss of material. The small contractor may think that he saves some of these items, but if he analyses matters carefully he will find that he has to pay them all in the end. If he is his own manager, he should consider the salary he would be making if doing it for someone else and should charge himself with the same salary. When all these things are taken into consideration I believe he will find his expense running between 20 per cent. and 25 per cent. of the sales. In discussing these problems it is customary to assume a figure of 25 per cent. This may have been right a few years ago, but we believe it should be more now.

Three Methods of Getting Overhead

First Method.—It is a very simple matter for us at the end of the year to sit down and take our expense after the bills are all paid, figure out a percentage of overhead and determine to use it through the following year, but I believe a more careful study of the matter is needed than by simply arriving at a certain percentage. I have not seen any article suggesting any method of figuring overhead expense except to take a flat rate and apply it to all our business. This we will call the first method.

But this I object to. If we take this percentage and apply it to the sale of an attachment plug where we fiddle around 15 or 20 minutes making a connection for nothing, you are going to be very sadly in the hole. If we take this percentage and apply it to a 15-horse-power motor you are going to be beat out by some of your competitors. I do not say that it costs as much time or worry to connect the 25-cent attachment plug as it does to sell the $250 motor, but I do say that the percentage of overhead should be as many times as great on one job as on the other.

Second Method.—The second method advanced for solving this problem is to have a different rate of overhead to apply to different pieces of cost. This can be illustrated by a chart covering the year's business. Now this chart gives a complicated method of figuring expenses wherein you will have to use some such proportion of this:

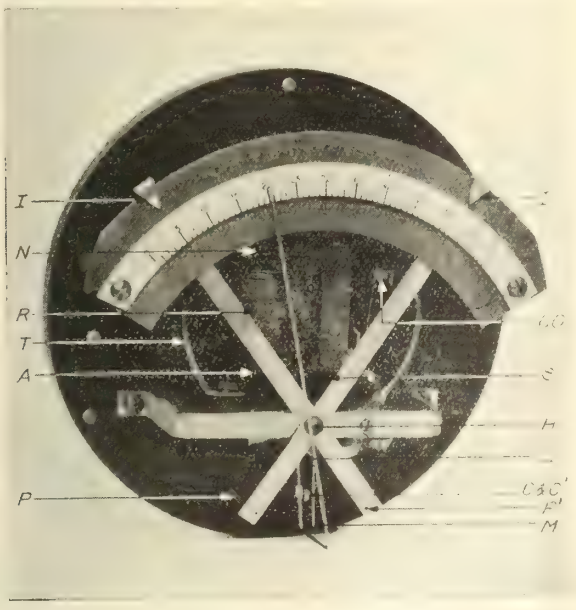
Material	$100.00
5 per cent. overhead on material	5.00
Labor	50.00
14 per cent. overhead on labor	7.00
	$162.00
25 per cent. on general expense	32.40
	$194.40
10 per cent. profit (approximately)	20.60
Total	$215.00

This is the second method of figuring overhead expense and one that is used in most businesses, but to which I still object as it does not show the proper relation of cost between small and large jobs.

Third Method.—What I am trying to get at is that it costs a great deal more in proportion to handle the small job than it does to handle a large job. If we have a hundred $5 jobs and one $500 job, we will figure 9/10 of our time fiddling around with the little job and 1/10 attending to the large job. I believe that the little jobs should carry many times the overhead expense that the big job carries. I do not know any way to separate this expense between the small and the large jobs in the way I have done between material and labor above.

But the truth is we are getting a higher rate of gross profits on the small job and we believe this will give us a key in the right proportion in figuring this expense. I have, accordingly, analyzed the business of a certain month and grouped together all the jobs that cost less than $1, $2, etc. You will find the same standard in all these groups, namely, that we are taking a much larger gross profit on the small job and a much smaller gross profit on the large jobs. I got still better results by taking together the entire group of jobs handled in four months, as shown in the table herewith:

No. of Jobs	Sale	Cost	Average Cost	Per cent. Gross Profit
382	$ 409.34	$ 205.69	$ 0.54	99
380	1,236.31	649.30	1.71	90.3
201	1,632.65	907.37	4.51	79.
192	3,802,53	2,325.15	12.11	63
125	5,850.82	3,905.77	31.24	50
90	7,974.21	6,322.41	70.25	26.1
51	8,194.06	6,678.58	130.95	22.6
14	4,992.47	3,942.90	281.58	26.6
13	16,816.90	13,403.45	1,031.03	25.5
1,448	$50,909.29	$38,339.81		

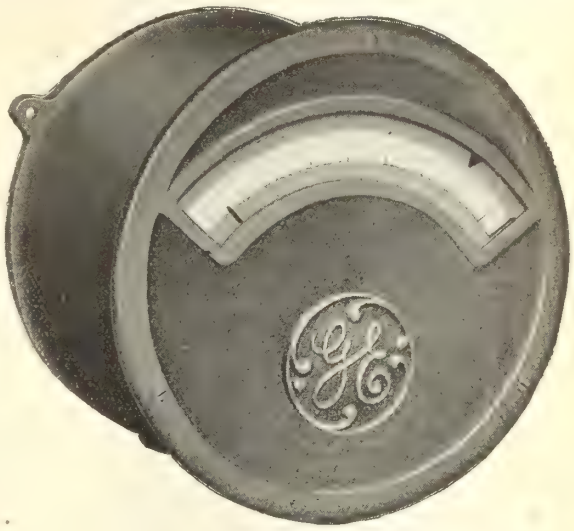


This gives a total of 1,448 jobs at a total cost of about $38,000, and a total selling price of nearly $51,000. I argue that it is fair to apply our overhead expense in the same proportion as the gross profits on this group of work. If we can get some way to figure overhead expense so it follows a definite line, we will get a method which will let us put a fair price on all our work.

* By P. C. Burrell, before Wisconsin Contractors' Association.

What is New in Electrical Equipment

A New Pressure Governor for Gas and Liquid Systems.



A new pressure governor to control standard self-starters for motor operated pumps and compressors has been developed by the Canadian General Electric Company. The governor maintains a pressure between predetermined limits on any gas or liquid systems that will not corrode the Bourdon tube. This governor is called the CR 2922 and can be used on any standard A. C. or D. C. circuit. It is rated for pressures of 60, 100, 160, 300 or 500 pounds, and operates within settings of from 3 to 12 pounds between high and low pressures. Governors for higher pressures can be supplied if desired. The governor consists of a Bourdon tube, an indicating needle, a graduated pressure scale, adjustable high and low pressure stops to detemine the desired pressure range and a relay which actuates the contacts in the control circuit of the self-starter, all enclosed within a dust-proof case easily opened for inspection. Action of the governor is dependent on the Bourdon tube which should be connected to an independent discharge pipe from the pressure tank. The free end of the tube "T" (See Figure) is mechanically connected to the indicator needle "'N," moving it over the scale as changes of pressure affect the tube. After the settings for the pressure

Pressure governor, cover removed.

range have been made, the governor will automatically maintain pressure within those limits.

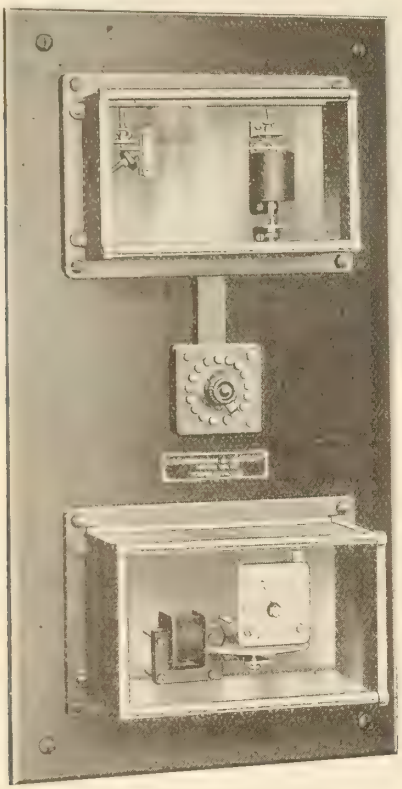
The operation of the pressure governor is as follows: Assuming that the pressure is at the low value, as indicated by the left hand indicator (I), the contact (C) on the needle (N) completes the circuit through the contact (C') on the movable arm (M) which at the low pressure point rests against the stop (P'). When this contact is made, the circuit is completed through the relay coil (R), causing the armature (A) to close. Attached to this is the contact (CO) which upon closing, completes the control circuit to the self-starter, causing the motor to start. The armature is also attached to the spring (S) which holds the contact (C') firmly against (C) until contact is broken at (P). As the pressure increases, the needle pointer moves to the right, but its lower part to which the contact (C) is attached moves to the left, and is followed by the movable arm (M). When the high pressure point is reached, the movable arm is prevented from traveling farther by stop (P) and the needle continues its course, breaking the circuit by separating contacts (C and C'). The instant the circuit is broken, the delay (R) is de-energized, its armature falls, releasing the tension on the spring (S) and because the movable arm (M) is counterweighted it returns to the stop post (P'). When the pressure is decreased to the minimum value, the contact (C) again completes

Pressure governor, complete.

the relay coil circuit by engaging contact (C') and the cycle of operation is repeated. The case is tapped and drilled at the bottom for the pressure pipe and electrical conduit connections.

Instrument gives Warning of Peak Load Excess

The peak load and its effect on the distribution system, has perhaps been given more consideration by station engineers than any other problem with which the latter have had to deal, with the result that its effect on the commercial success of the undertaking is very fully realized. The result has been the adoption of a number of different methods of charging, each suited more or less to specific local conditions. Among these methods may be mentioned:



1. Ampere maximum demand;
2. A two rate principle;
3. A restricted hour use;
4. Flat charge for a definite h.p. with a motor reading in kilowatt hours all current consumed in excess of the definite h.p.;
5. Kilowatt hours maximum demand;
   - (a) Based on the h.p. installed;
   - (b) Based on the maximum demand meter;
   - (c) Based on the graphic meter.

Of these 5 (b) and 5 (c) are becoming more and more common for large customers and would appear to be essentially fair to both the customer and the supply authority, provided that it is understood by the customer. Unfortunately this is not always the case, and the effect on the customer is easily illustrated by an actual example. Presume that the normal requirements of the customer caller for 100 h.p. In one particular district of Canada the service charge as shown by a maximum demand meter is $1.00 per h.p. per month.

The meter charges is: The first 50 hours use at 2.6; the second 50 hours use at 1.8, the balance at 1.5. Assuming that the customer runs 10 hours per day on the unrestricted basis, the bill is subject to discount of 10 per cent. cash, and would read as follows:

Service charge	100 H. P.=	$100.00
Consumption charge		
First 50 hours' (75 kw. x 50)=3750 kw.h. at 2.6		$97.50
Second 50 hours'	=3750 kw.h. at 1.8	$67.50
Balance, 150 hours	=8250 kw.h. at .15	$12.40
Total	15750	$277.40
Cash discount		$27.74
Net Bill		$249.66

For a load of less than 200 h.p. the peak is taken at one minute. Therefore if once during a month, due to carelessness

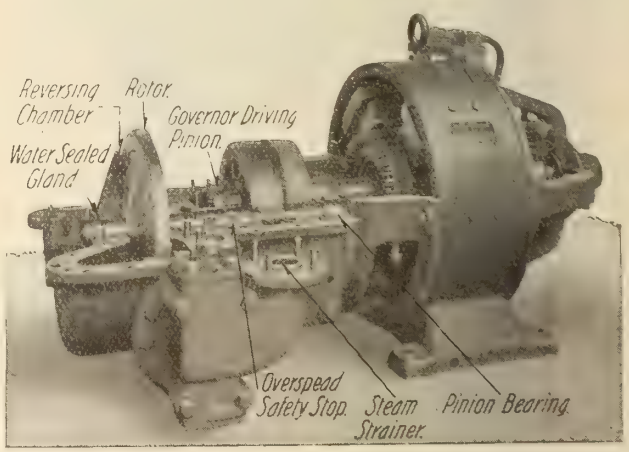
Instrument for giving peak load warning.

or ignorance, the load is permitted to rise to 125 h. p. for one minute, the bill would read as follows:

Service Charge. 125 H.P.		$125.00
Consumption Charge.		
First 50 hours (93.7 kw. x 50)=4680 kw.h. at 2.6		$122.00
Second 50 hours use	=4680 kw.h. at 1.8	84.50
Balance 6390 kw.hrs.	at .15	9.58
Total	15750	$341.08
Less 10 per cent. discount		34.10
Net Bill		$306.98

This shows that the customer would pay $57.32 more in the second instance than he would in the first for exactly the same kw. hours consumption, in spite of the fact that the output in his factory would probably not be increased at all.

To assist the customer to control this situation, an instrument has recently been placed on the market which gives the customer warning when the peak duration is prolonged. This instrument is shown in the Figure. It consists of a current element, rheostat for control of the current element, time lagging element, bell ringing transformer and bell. The current element is built with a standard of 5 ampere winding for use with the transformer. It is capable of adjustment to the required lead by means of the steps of the rheostat, from 1.5 to 5 amps.



The time element has a range in the instrument shown, from 0 to 5 minutes. The time range can, however, be arranged for any particular requirements by a slight change in the gearing. The method of operation is as follows:

The current element is set to the maximum load required during the month and the time element slightly under the maximum permitted by the power contract for the above amount of power. When the current rises to or above the set maximum, the current element immediately operates, throwing current on to the time element. This element then operates until the time setting is reached, when the bell rings out a warning that the load is excessive. The construction of the instrument is such that it is only necessary to reduce the current 3 per cent. below the predetermined load for the bell to cease ringing and reset the time element.

Platinum points are used throughout, and the meter, if anything, errs on the side of solid construction. The instrument is being manufactured by the Chamberlain & Hookham Meter Co. Ltd. of Toronto, following the design of Mr. S. L. B. Lines, the general manager of the company.

Small Geared Turbines.

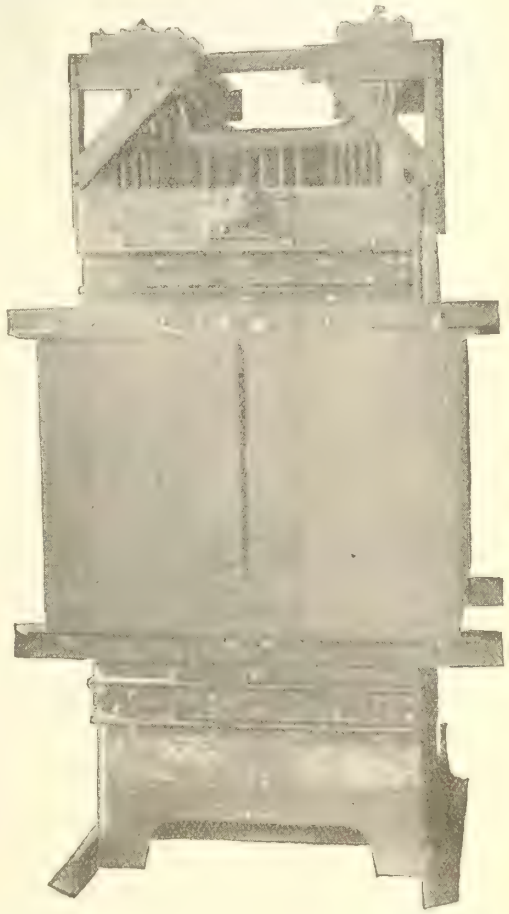
To drive small electric lighting outfits, exciter units for large alternators, or for direct mechanical drive, there has been a demand for a line of steam turbines which would be constructed along the same lines which give durability, ease of adustment, and high economy to the larger turbine units. To meet this demand, which now comes principally from our new merchant marine for lighting sets, the Westinghouse Electric & Manufacturing Company has developed a line which is being manufactured in sizes from 15 to 50 kw. for direct-current service; from 30 to 50 kw. for alternating-current service, and from 30 to 100 h.p. for mechanical drive. This machine is a geared unit, very compact, and of rugged

construction, as shown in the view of the direct-current unit. The turbine operates at a speed of 7200 r.p.m. and it is suitable for both condensing and non-condensing operation. It is built for normal operation on any steam pressure from 75 lbs. to 250 lbs., and for non-condensing operation on any back pressure up to 20 lbs. It embodies the three-point suspension principle, being supported by two lugs on the generator and one under the centre of the turbine, thus maintaining perfect alignment of the turbine, gear and generator.

The generator is of the well-known Westinghouse "SK" type, compound wound, with commutating poles. This designe insures sparkless commutation even at heavy overloads without shifting the brushes—an important advantage since no

attention is required to adjust for changing loads. Coils are impregnated by the vacuum process, making them proof against even extreme dampness. The outboard generator bearing is supported by a single-piece bracket bolted to the frame. In this a steel shell lined with babbitt forms the bearing itself; it is pressed and pinned into place and in case of trouble can readily be renewed by driving out with heavy hammer. Oiling is by a ring running over the shaft and dipping into an oil well. The shaft may be pressed out of the armature without disturbing the connection between coils and commutator. Liberal spaces for ventilation are provided. The internal construction of the turbine is practically identical with that of the larger machines. It consists of a single rotating wheel with blades or buckets around its periphery; the steam from the directing vanes or nozzles impinging against these blades, causes the wheel to rotate and the work to be performed. The full energy of the steam is extracted by using only one wheel with the aid of what is commonly known as the re-entry principle; that is, the steam after passing through the blades the first time, is changed in direction by means of reversing chamber and is directed against the blades a second time. The nozzle and reversing chamber are made of phosphor bronze, designed specially to resist the erosive action of steam at high velocities. In the 15 and 25 kilowatt units, the nozzle block contains but one nozzle, while in units from twenty-five to fifty kilowatts capacity, the block contains two nozzles, one of which is controlled by a hand operated valve; at partial loads this valve may be closed and thus the water rates are greatly decreased, and a much higher efficiency is obtained.

One of the special features on this unit is the automatic throttle valve, operated directly from the governor by means of a connecting rod. This valve is of the balanced type and very sensitive in operation, thus insuring a close speed regulation. One of the latest refinements provided on very few small turbines, is the overspeed governor release. This is a simple device contained in a small hole drilled in the shaft between pinion and rotor, and it consists of a cylindrical weight held in place by a coil spring surrounding it. In case the turbine should speed up to ten per cent. above normal speed, the weight due to centrifugal force, overcomes the spring tension and protrudes a short distance from its normal position. By so doing it comes in contact with a lug, which, in turn, is fastened to a lever, the movement of which trips the throttle valve catch and allows the valve to be closed by a heavy coil spring.



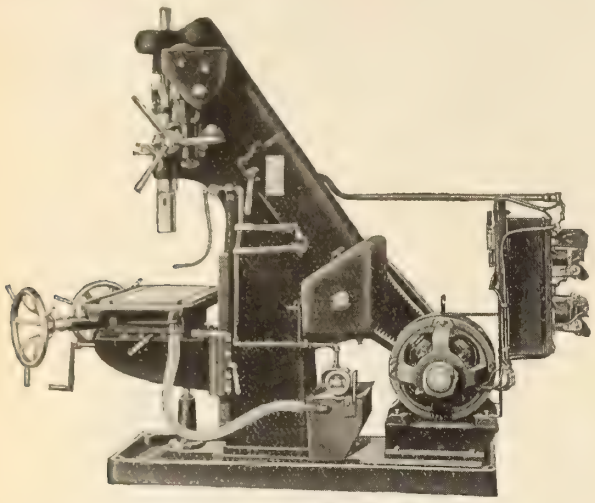
Large Hydro Transformers

The Canadian General Electric Company is now completing, at Peterboro, an order for fifteen 5,000 kv.a., 25 cycle, 110,000 volt transformers for the Hydro Electric Power Commission of Ontario. These transformers are for the Strachan Avenue Terminal Station of the Commission at Toronto, and nine of the fifteen units are already installed. When the installation is completed in a month or two, the Commission will have in this station a total transformer capacity of 75,000 kv.a., on the basis of 40 degs. C. rating or approximately 100,000 kv.a. on the basis of maximum rating.

The Toronto Station was originally laid out for two banks of 1,250 kv.a. transformers with one spare unit. At a later date, the 1,250 kv.a. units were replaced by 2,500 kv.a. units, and later, the station was extended to accommodate three additional banks of 2,500 kv.a. transformers. Two of these banks were installed but, before the last bank was ordererd, the decision was reached to again double the unit capacity. To accomplish this with the floor space limitations of the original transformer pockets, it was necessary to increase the height dimensions very materially. The new units measure 24 feet from the rails to the top of the high tension heads. This accounts for the slim appearance of the tank as shown in the accompanying cut. The floor space limitations also precluded the possibility of using core type construction in this case.

The transformers are shell type units with reinforced steel plate housing and supports. The economy in weight by this construction made it possible to utilize the existing foundations without material change, in spite of the fact that the main weight of the transformer loading is carried over to the central foundation wall by a short cantilever construction.

The transformers have button type spacers between coils and the coil ends extending above and below the core are firmly braced against distortion from short circuit strains.

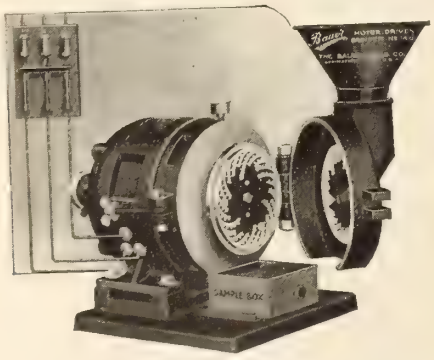


Particular attention is drawn to the appearance of the core in the accompanying cut showing the core and the coil housing. The cut, however, does not do justice to the unusually fine results which the Peterborough organization is accomplishing in piling sheet steel laminations.

The tanks for these transformers, which, it will be noted, are without horizontal seams, were made at the Davenport Works, Canadian Allis-Chalmers, Limited.

Motor-Driven Drill and Tapper

To speed up production without danger to machine or operators, is the purpose of the new Barnes self-oiling, all geared drill and tapper which handles high speed twist drills from ½-inch to 2 inches. This is essentially a manufacturing machine, built for heavy duty work and rapid production. Belts are entirely eliminated, all power being transmitted through gears. With the exception of the spindle sleeves and cross spindles, all bearings and all gears are continuously lubricated by an automatic self-oiling system. The oil for this purpose is pumped from the reservoir at the base of the machine by a geared pump. Eight changes of speed are provided, with control levers within easy reach of the oper-

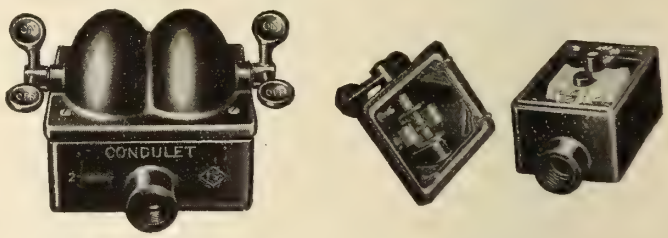


ator from his position in front of the drill. The spindle may be stopped by placing the shifter lever on the neutral position, or by throwing out the clutch gear. All transmission gears except the friction clutch gears, are cut from special high-grade chrome nickel steel, heat-treated, and tempered to

prevent wear, and to increase strength and stiffness. There are ten instant changes of geared feeds, controlled by levers directly in front of the operator. The feeds are indicated in plain figures on an index dial plate. All important feed gears are cut from steel and are case-hardened. A safety collar protects the machine against damage from overloads. For tapping, the machine may be equipped with an automatic reversing mechanism, which is very desirable, especially for depth tapping. A trip on this mechanism can be set so that the instant the tap reaches the depth required, the spindle will automatically reverse. It is also possible to set the shifting lever so that when tripped, either automatically or by hand, it will return to the neutral position, thus stopping the spindle instantly instead of reversing it. A small hand trip lever is always ready for use if it is desired to stop or reverse the spindle at any point in the operation. These machines are driven through a silent chain by a Westinghouse 10 h.p. direct-current motor provided with a Westinghouse automatic starting panel. This panel is shown exposed in the illustration, but is provided with a metal case when desired. All gears are entirely enclosed, meeting the requirements of modern safety laws.

Electric-Driven Laboratory Grinder.

A unique electric-driven grinder for laboratory service has recently been developed by The Bauer Bros. Co., Springfield.



As shown by the illustration the outfit consists of a Robbins & Myers motor with one end head replaced by the grinder mechanism which is directly connected to the motor shaft. The grinder opens like a watch and all interior parts are readily accessible and easily cleaned, so a variety of materials can be ground in the machine without any one sample being contaminated by the others. The outfit is used chiefly by commercial laboratories for grinding samples of cotton seed cake, linseed cake, corn cake and feed stuffs of all kinds, also for coal and nearly any materials which require grinding in the laboratory for analysis. The outfit is also used where small amounts of materials are ground continuously and for this service it is provided with a special base which permits a constant flow of materials to pass through the mill. The dimensions of the outfit are as follows: Height overall, 24 inches, width overall, 16 inches; length overall closed 25 inches, open 32 inches. The hopper is 10 inches in diameter, and the plates are 8 inches in diameter. The speed is 1800 r. p. m. and the weight is 300 pounds.

The outfits are regularly stocked with 3 horse-power, 220 volt, 3 phase 60 cycle motors, but can be furnished on order with 2 or 3 phase, 110, 440, or 550 volt motors.

Makes Push Switch Installations Steam-Tight

Double push button switches, because of their ease of operation, have always been popular, but their use has been restricted by reason of the liability of moisture, gas or dust getting into the operating parts. The Crouse-Hinds Company have designed and placed upon the market a cover with a switch-operating mechanism for use with these switches, when installed on condulets of either the FS or FD series, which eliminates the objectionable features. This cover is made in one and two-gang forms. In one of the accompanying illustrations a two-gang cover is shown installed on a condulet, while the other illustration is of single gang condulet and cover, with cover unmounted. Like the condulet, the cover is a casting, either iron or brass, as specified. Iron covers are regularly finished in black enamel, although

galvanized finish or any other plated finish will be furnished, if desired. Marine finish is standard for brass covers. The mechanism which operates the push button is under the dome of the cover and is controlled by a shaft, flattened at its inner end and extending through the side of the cover, where it terminates in the operating handle. That portion of the shaft which passes through the cover is provided with grooves containing hard grease, which effectually seals the bearing, and a rubber gasket likewise seals the joint between the cover and condulet. "On" and "Off" indicators, cast on the ends of the handle, facilitate the operation of the switch. With this cover and the necessary condulet, it is now practical to use push switches in places where excessive moisture, explosive or corrosive vapors or fine dust circulate in the atmosphere, as in marine use, ammunition plants, refineries, textile and flour mills and the numberless other locations which readily suggest themselves to the electrician. Complete description and listings of these covers are given in Condulet Bulletin No. 1000H, which has just been released by the Crouse-Hinds Company, and will be mailed on request.

Mr. Henry Holgate, consulting engineer, Montreal; Mr. Guy W. Currier, chief counsel for the receiver of the Bay State Street Railway Company, Boston; and Prof. Albert S. Richey, Worcester Polytechnic Institute, Worcester, Mass., have been appointed by the New Brunswick Government to investigate the affairs of the New Brunswick Power Company and decide upon the merits of that company's application for an increase in rates in street car fares in St. John.

Personals

Mr. S. Wilkins, formerly engineer, Winnipeg Electric Railway, has been appointed maintenance engineer.

Mr. C. Bibby has been appointed assistant superintendent and secretary of the Sudbury-Copper Cliff Suburban Electric Railway, succeeding the former secretary, Mr. M. J. Powell.

Mr. Lawford Grant, manager of Eugene F. Phillips' Electrical Works, Ltd., has been elected a representative of the Montreal branch of the Canadian Manufacturers' Association on the executive council of the Association.

Captain W. G. Conway has been appointed secretary of the British Columbia Association of Electrical Contractors and Dealers. Captain Conway is said to be one of the livest wires in the city of Vancouver and there is every indication that this Association will forge ahead.

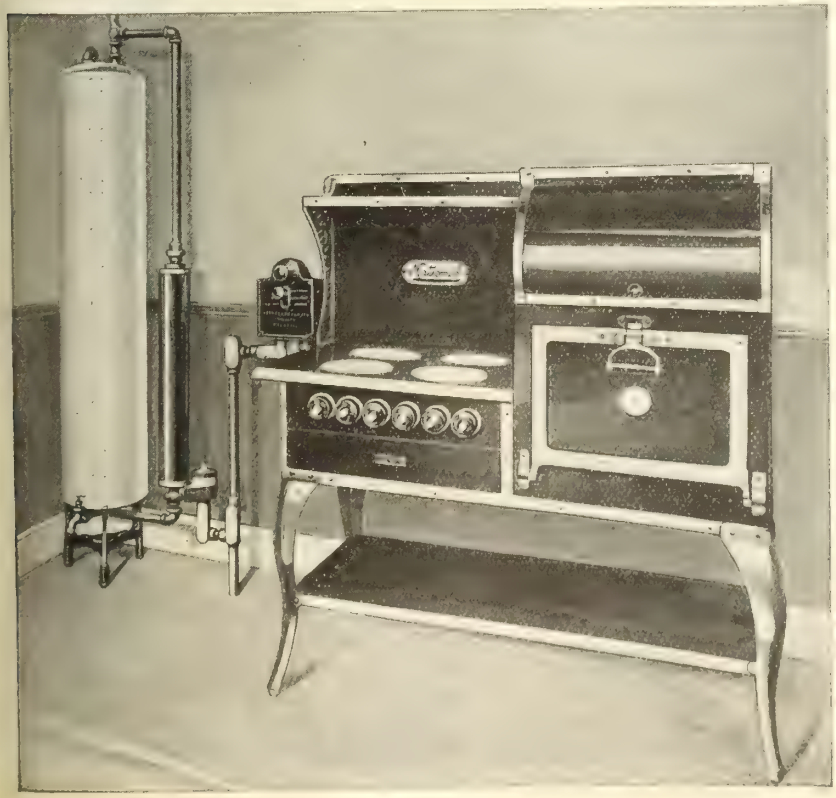
Major George W. Shearer, M. Sc., Assoc. Mem. of the Engineering Institute of Canada, Montreal, has been awarded the D.S.O. Before joining the 27th Battery, C.F.A., in 1915, he was practising as an electrical engineer, being a graduate of McGill University. He is in command of the 11th Battery, C.F.A.

Mr. F. H. Williams has been appointed publicity agent of the Winnipeg Electric Railway Company, succeeding Mr. H. C. Howard. Mr. Williams will continue the policy of this company of cementing the bond of good fellowship between the Company and its patrons in all matters pertaining to the operation of the system.

Mr. Thomas Henry has opened an office at 58 Front Street West, Toronto, where he will act as consulting engineer on power proposals, including both construction and operation. Mr. Henry is also acting as machinery broker for power equipment of all kinds—steam, electric and hydraulic. He has had wide experience, having designed and built the Erindale hydro-electric plant of the Interurban Electric Company and, as chief engineer, operated this plant for 12 years. He has latterly been on the staff of the Toronto Electric Light Company.

Trade Publications.

Ward Leonard—Enamelled Resistance Units, another booklet on field Rheostats, by the Ward Leonard Electric Company; both well illustrated and containing a quantity of useful, general information.



Induction Motors—Bulletin No. 3000 by the Canadian General Electric Company; illustrating and describing polyphase induction motors.

Electrical Features in New Ship Industry

Coincident with the establishment of the wooden shipbuilding industry in the West were born many dependent enterprises—among these the turning of wooden spars, which is handled by such firms as the Western Spar Company, of Portland, Ore. In former days this work was done mostly by hand labor, or steam-driven machinery, but to-day the entire equipment is electrical. In the above company's plant there are two large woodworking lathes, which can turn spars 160 feet in length; they are equipped with 220-volt, 3-phase induction motors, as follows: Three 15 h.p. three 5 h.p., three 1 h.p., and one 3 h.p. The 15 h.p. motors are on the carriages to drive the cutting tool and other apparatus, and have to be installed with long, flexible cable connection, so that they may be run back and forth over the 160-foot length of track. Plugs are installed midway on the run and supporting the cable on strain insulators strung on a steel messenger wire.

Electric Railway Supplies—Catalogue No. 18, by the Drew Electric Company, Indianapolis; illustrating and describing their line material and electric railway supplies—a handsome catalogue of 96 pages.

The Quebec Streams Commission have returned all tenders for the construction of the proposed storage dam at Lake Brule, ten miles from Beaupre, P.Q. The estimates were too high to justify, in the opinion of the Commission, work being proceeded with, and it has consequently been postponed. The dam would have given additional water power to the hydro-electric plant of the Laurentian Power Co.

A Handsome Catalogue of Electric Heating Equipment.

The National Electric Heating Company, Toronto, are distributing a handsome 56 page catalogue describing their various products. These include domestic and commercial irons; a variety of household and kitchen utensils, such as toasters, disc stoves, percolaters, chafing dishes, etc.; their well-known line of electric ranges from a single burner hot plate to the biggest range required for large families, hotels or restaurants; circulation water heaters; glower type air heaters; portable and stationary air heaters for the home, office, warehouse, street car or automobile; luminous type house radiators; special radiators up to 200 kw. capacity; a number of special appliances such as glue pots, celluloid press, bread sealing machine, electrically heated glove forms, etc. The catalogue is splendidly illustrated. The illustration herewith shows a model arrangement with range and hot water heater occupying a minimum of space and giving a maximum of service.

Current News and Notes

Brantford, Ont.

The threatened strike of employees on the Brantford Municipal Railway has been averted, the men accepting the new rates of pay offered by the city, namely, 29, 31 and 32 cents an hour. The old rates were 23, 25 and 26 cents an hour.

Esteven, Sask.

It is stated that a government plant for the manufacture of lignite briquettes will be established near Estevan, in the near future. It is further reported that the plant will cost $400,000 and be in operation by next winter.

Fort William, Ont.

Women conductors are a possibility on the Fort William electric railway shortly.

Gladstone, Man.

The town council of Gladstone, Man., contemplates the installation of an electric lighting and power system.

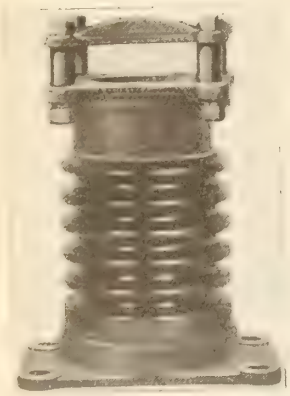
London, Ont.

Employees of the London Street Railway Company have been granted a new wage schedule of 30, 32 and 35 cents an hour. Formerly the highest rate was 28 cents an hour. By the new agreement the men also get 10 cents more per hour for overtime.

Newcastle, N.B.

The town council of Newcastle, N.B., have raised the electric light rates from 15 to 20 cents per kw.h. A discount of 20 per cent. is allowed for prompt payment.

Ottawa, Ont.



It is not impossible that in the near future the citizens of Ottawa, Ont., will be requested to vote on the question of purchasing the Ottawa Electric Railway. Figures given in the last annual statement of the company indicate that it was the most successful year in the company's history. Gross earnings amounted to $1,240,627; total expenses were $830,961, leaving a net surplus of $409,665. Passengers carried numbered 29,347,692 and dividends amounting to 15 per cent. were paid.

Regina, Sask.

A committee has been appointed by the city of Regina, Sask., to enquire into the efficiency and management of the street railway department. The scope of the enquiry will cover the handling of tickets and money, accounting, traffic organization, efficiency of employees, track and equipment maintenance.

In our last issue it was stated that the light and power rates in the city of Regina would be increased 10 per cent. and that the plant had been operating at a loss. Our source of information proved inaccurate, however, as we have been since advised that this plant has not operated at a loss for twelve years but, on the contrary, has turned over a very substantial surplus each year to lower the tax rate of the city—in 1915, $54,917; 1916, $57,061, and 1917, $24,005. The object of increasing the rates is to provide for a surplus after meeting the increased cost of coal and labor—the advances being approximately 40 per cent. since the light and power rates were fixed.

Safeguard the One Vital Point in the Central Station—*the bus bars*

OTHER individual parts of the equipment may fail or be destroyed—but as long as your switchboard and main bus bars remain intact, you can redistribute the load and keep the power flowing.

Franklin Bus Bar Supports combine great mechanical strength, great electrical strength, with sound engineering design and the finest workmanship. They have many superior features.

Consider most carefully the bus bar supports you install.

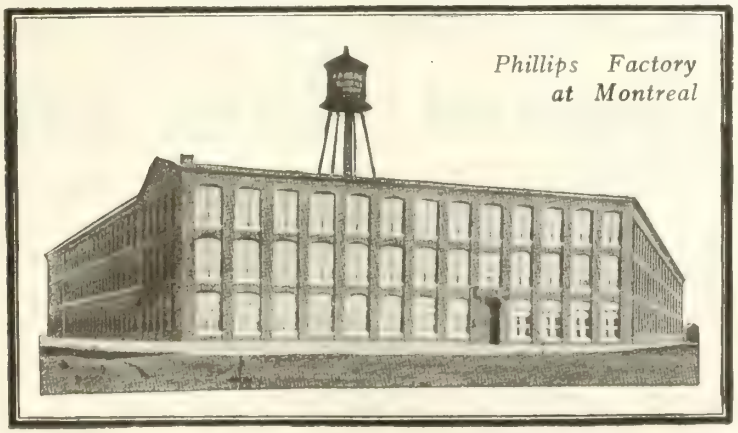
PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

PARLIAMENT BUILDINGS, OTTAWA

Tenders Wanted for Lighting Fixtures

Sealed tenders will be received by the undersigned until noon, July 2, 1918, for the lighting fixtures required in the reconstruction of the Victoria Building.

All tenders to be based on the execution, installation and completion, together with the furnishing of all material, tools, appliances, labor, etc., necessary and as required and described by the plans, specifications and schedule for lighting fixtures.

The work of this contract shall be proceeded with as indicated in the Schedule or as may be directed and in such a manner as to ensure the completion thereof by November 1, 1919.

Plans, Specifications, Schedule and any other information required can be obtained at the office of the General Contractors, P. Lyall & Sons Construction Company, Limited, Ottawa, Ontario.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, for a sum not less than five per cent. (5 p.c.) of the amount of the tender, which will be forfeited if the parties tendering decline to enter into a contract when called upon to do so. If the tender is not accepted the cheque will be returned. If the tender is accepted an additional cheque for a sum equivalent to five per cent. (5 p.c.) of the amount of the tender must be deposited before the contract is signed. The total security will be forfeited if the contractor fails to complete the work contracted for.

Payments for material will be made monthly. Samples must be submitted with tender.

The lowest or any tender not necessarily accepted.

Envelopes containing tenders to be marked "Tenders for Lighting Fixtures," and addressed to the undersigned.

JOHN A. PEARSON, Architect,
J. O. MARCHAND, Associate.
Centre Block, Parliament Hill,
Ottawa.

FOR SALE

Electric Light Plant in good town, divisional point in Alberta, exclusive franchise, good rates and good load. Reason for selling, owners interested in other business. Box 746, Electrical News, Toronto. 12-13

MOTOR FOR SALE

Type C., constant speed, 100 h.p., 225 ampere per terminal, 2 phase, full load speed 580, alternating 720.

Apply Armour & Co., Wentworth St. North, Hamilton, Ont. 12-14

New Transformers S.P.
13,200 to 6600/2200 Volt
$900 each

To be sold immediately

Wire for particulars

E. A. LOWRY - GUELPH, ONT.

Rubber Covered Wires and Cables

FOR POWER, LIGHT AND TELEPHONE WORK

Incandescent Lamp Cord, Flexible Switchboard Cables, Special Cords and Cables for all kinds of Electrical Work.

Prompt Shipments from Canadian Factory.

BOSTON INSULATED WIRE & CABLE CO., Limited

Canadian Office and Factory, HAMILTON, ONT.

Ready for Immediate Delivery

ALTERNATING CURRENT

—100 K.W., General Electric, 3 phase, 60 cycle, 2300 volt generator, type GTB, form D, complete with switchboards.

—200 KW., 3 phase, 60 cycle, 1100 volt, General Electric generator, type GTB, form D, speed 600.

—450 K.V.A., 2300 volt, Allis-Chalmers, 200 speed, 3 phase, 60 cycle generator, 2 years old, good for direct connection for engine drive or water wheel drive.

—100 H.P. new Westinghouse motor, 3 phase, 60 cycle, 550 volt. 900 speed.

—100 H.P., new General Electric, 3 phase, 60 cycle, 440 volt, 720 speed, slip ring, complete for heavy starting duty.

1—50 H.P. new General Electric, 440 volt, 1200 speed, 3 phase, 60 cycle, slip ring motor.

1—50 H.P. General Electric, 220 volt, 900 speed, type I, form L.

2—50 H.P. new Allis-Chalmers, 550 volt, 3 phase, 60 cycle, 900 speed motors.

MOTOR GENERATOR SET

1—40 KW., 125 volt, General Electric, 720 speed, type CL, form B, 6 pole generator, connected on one sub base to a 60 H.P., 3 phase, 60 cycle, 2080 volt, 720 speed, type M, form C, Fort Wayne motor in A1 condition and complete. Three bearing machine.

DIRECT CURRENT

2—100 H.P., 110 volt, Holtzer-Cabot D.C. motors, 550 r.p.m., full commutators.

1—10 KW., 125 volt, Bullock, 400 speed, marine set, direct connected on one sub base to a Westinghouse vertical engine.

1—50 KW., 125 volt, General Electric, 280 speed, type MP generator, direct connected to an 11 x 12 vertical marine type engine.

1—300 KW., 500 volt, D.C. General Electric generator, 400 r.p.m.

1—56¼ KW., 125 volt Westinghouse, 800 speed, type M generator, complete and in A1 condition.

1—80 KW., 125 volt, Crocker-Wheeler, 750 speed, type CCD generator.

1—90 KW., 110 volt, General Electric, 690 speed, type CL, 6 pole, form B generator.

1—300 KW., 550 volt, General Electric, 400 speed, type MP generator, D.C.

BOILERS

3—300 H.P. Holyoke Manning Boilers, now located in Massachusetts; good for 150 lbs; 11 years old, in splendid condition.

5—150 H.P. Manning Boilers, now located in New Hampshire; good for 135-140 lbs. Immediate delivery.

6—90" x 18' 6" horizontal return tubular Dillon Boilers, now located in Rhode Island, installed in 1905, for delivery in 2 months.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL
The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"
Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"
Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"
Fire-resisting paint, or colorless solution.

"ARMACELL"
Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"
Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"
for coloring electric lamps. Used in the Royal Navy. Weatherproof. Dries rapidly.

"ARMABRON"
Bitumen protective paint, elastic, acid-resisting, weatherproof.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right

KRAFT CORD "BRAIDUCT" tests far above all requirements of the Underwriters.

We will be glad to send you a sample.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:

"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

Water Turbines

Hydraulic Governors

High Efficiency Pumps

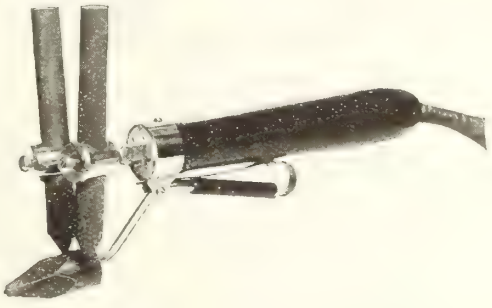
Vertical Turbines

shown in the accompanying illustration were designed and manufactured by us for the Hydro-Electric Power Commission of Ontario. They are among the largest water turbines installed in Canada and are characteristic of the high efficiency of our engineering department.

The services of these experts are at your disposal to consult on any of your engineering troubles.

BOVING HYDRAULIC & ENGINEERING CO., LIMITED

LINDSAY - ONTARIO



50 H.P. Motor Stator Coils Being Soldered with J-C Soldering Iron, in Shops of Robertson Electric Corporation, City, Buffalo.

The New

J.C. Electric Soldering Iron

3 1/2 Hours Saved on a 5-Hour Job!

(70 per cent. saving)

Instead of taking 5 hours to solder the terminal leads of the stator coils of this motor the J. C. Soldering Iron cut this time to 1½ hours—a saving of 3½ hours. The secret of the efficiency of this remarkable Iron is the fact that it heats only while in contact with the work, and then heats almost instantaneously.

No time is lost at any stage of the work.

SQUARE D

STEEL ENCLOSED SWITCHES

Central Stations
Contractors
Dealers—all can derive big returns in economy or profit from the application or use of Square D Steel Enclosed Switches.

Consider these four points alone—complete enclosure of live parts and external operation minimize the possibility of the operator being shocked or burned. A lock-off device provides for locking the switch in the open position to guard against the accidental closing of the circuit.

Fire hazards and insurance costs reduced to a minimum. Motors, workmen and equipment are protected, ensuring maximum production and increased satisfaction among employees.

Be satisfied with nothing less than Square D—the original steel enclosed switch.

The Chief Benefit

derived from

"No Spark"

CARBON BRUSHES

IS FREEDOM FROM TROUBLE REPLACING AND RESETTING BRUSHES. Being self-lubricating, they make the contacts practically frictionless and reduce commutator repairs enough to pay for themselves several times over. With these carbon brushes, the machine runs noiselessly without any sparking. These are facts which you can at once prove.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.
THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the result may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

OXY-ACETYLENE WELDING & CUTTING

2 Boiler Sections Reclaimed

Welding these two Boiler sections saved over $100, being the difference between the cost of replacing them and the cost of the repairs, but their value during the time that would have been lost in waiting for replacements makes the actual monetary gain even more apparent.

These are ordinary repairs of every day occurrence. There are many similar uses for the Process in your Industry and the actual money saved by the installation of an Oxy-Acetylene Welding Plant would reduce the initial cost to insignificance.

Ask for further particulars

L'AIR LIQUIDE SOCIETY

WHITE'S PORCELAIN STRAIN INSULATORS

You want strain insulators that are strong physically, that stand up under the exceptional conditions of the heavy storm; that hold up under a load of sleet; that don't crack when the thunder rolls, the lightning flashes, and the wind whistles.

This is the kind of strains T. C. White Company is making of porcelain in a variety of sizes for different loads, and several designs for varying conditions.

It will pay you to write for bulletin which shows designs and gives the complete data on strain and electrical tests.

Write today.

THE "S.J.B." BOX

FOR SERIES ORNAMENTAL STREET LIGHTING SYSTEMS

¶ To provide a means of disconnecting lamps from circuits supplied with current by two-conductor cable, The Northern Electric Company have recently designed the "S.J.B." Box for use on series circuits operating at potentials of 7,000 volts or less.

¶ Figs. 1 and 2 show front and rear views of the box, and Fig. 3 shows how the box is installed in the pedestal of a lamp standard. This view was taken in Montreal where all of the standards used in connection with the new lighting system are equipped with these boxes.

¶ There are many interesting features in connection with this box, but the limited space at our disposal does not permit of a detailed explanation. To those interested, however, we will be glad to send photographs and full descriptive matter on application to our nearest branch house.

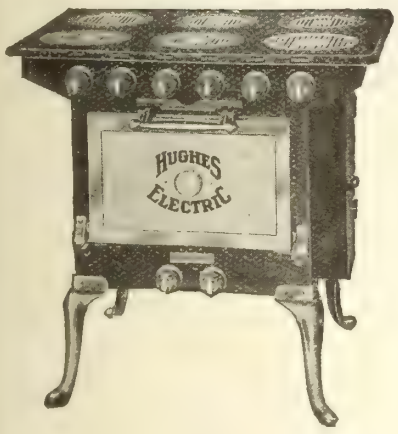
HUGHES
Electric Ranges



No. 50

HUGHES "50" ELECTRIC RANGE

This is one of the most popular styles of ranges on the market. Ideal for homes, suitable for medium or large size family, also for Clubs, Church Kitchens, etc.

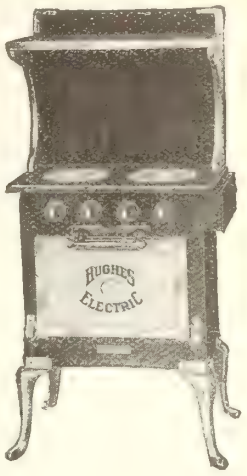
Features, 4-burner cooking surface, 2-burner oven, warming compartment, outside warming shelf, lower outside shelf. Finish either plain or nickled with white enamel splashers.

No. 48

HUGHES "48" ELECTRIC RANGE

Extremely handy; designed for large families, boarding houses, restaurants, hotels, clubs, etc., where a greater cooking capacity is required in a small space.

Features, 6-burner cooking surface, 2-burner oven. Finish either plain or nickle plated.



No. 44

HUGHES "44" ELECTRIC RANGE

A very popular range because it uses little floor space and has elevated oven, exclusively for families of average size.

Features: 4-burner cooking surface, 2-burner oven, lower outside shelf. Finish either plain or nickle plated.

No. 27

HUGHES "27" ELECTRIC RANGE

The most desirable Range for small or medium size families with limited kitchen space.

Features, 2-burner cooking surface, 2-burner oven, elevated outside warming shelf. Finish either plain or nickle plated.

Electricity Makes Cooking Scientific and Economical

SCIENTIFIC—because they have introduced and adopted, virtually, every fundamental improvement in the development of the modern electric range—the most complete line of electric cooking apparatus in the world.

ECONOMICAL—because of economy of current, of food, of time and trouble. The HUGHES ovens are so constructed as to make it possible to turn off the current long before the food is cooked, because it does not shrink or dry out the food it cooks, hence an appreciable saving in market bills.

No. C-18

HUGHES "C-18" ELECTRIC RANGE

It is solidly constructed of steel and cast iron, occupying floor space of only 17 x 25 inches, compact, neat, most suitable for light cooking. Finish plain black enamel.

HUGHES RANGES are sold with a year's guarantee against defects electrical and mechanical, backed by the reputation of their makers. They are without doubt the best and most economical electric ranges on the market.

Awarded GOLD MEDAL, Panama Pacific International Exposition, 1915.

Tested and approved by the Underwriters' Laboratories of the National Board of Fire Underwriters—and also by Good Housekeeping Institute.

Write our House nearest you for further information as to literature, prices, etc.

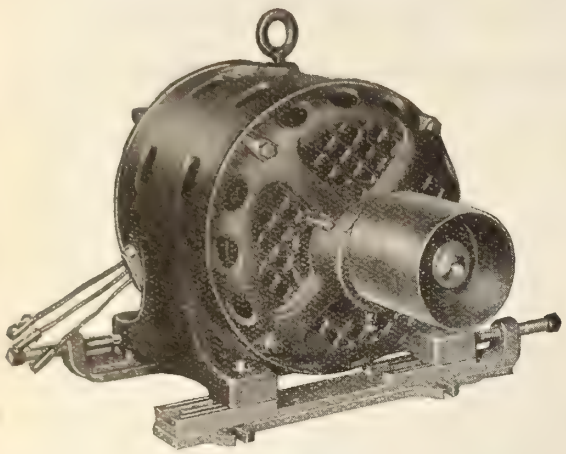
Keystone Car Signs

Standard on the Seattle Municipal Railway



The popularity of Keystone and Hunter types of illuminated car signs is not limited by geography. They are just as greatly appreciated on the shores of the Pacific as on the Atlantic Shores.

So it's not surprising to find Keystone car signs the standard of the Seattle Municipal Railway which appreciates that car signs legible beyond braking distance cuts down unnecessary stops (due to misunderstanding by intending riders) and ADVERTISE THE SERVICE.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right

KRAFT CORD "BRAIDUCT" tests far above all requirements of the Underwriters.

We will be glad to send you a sample.

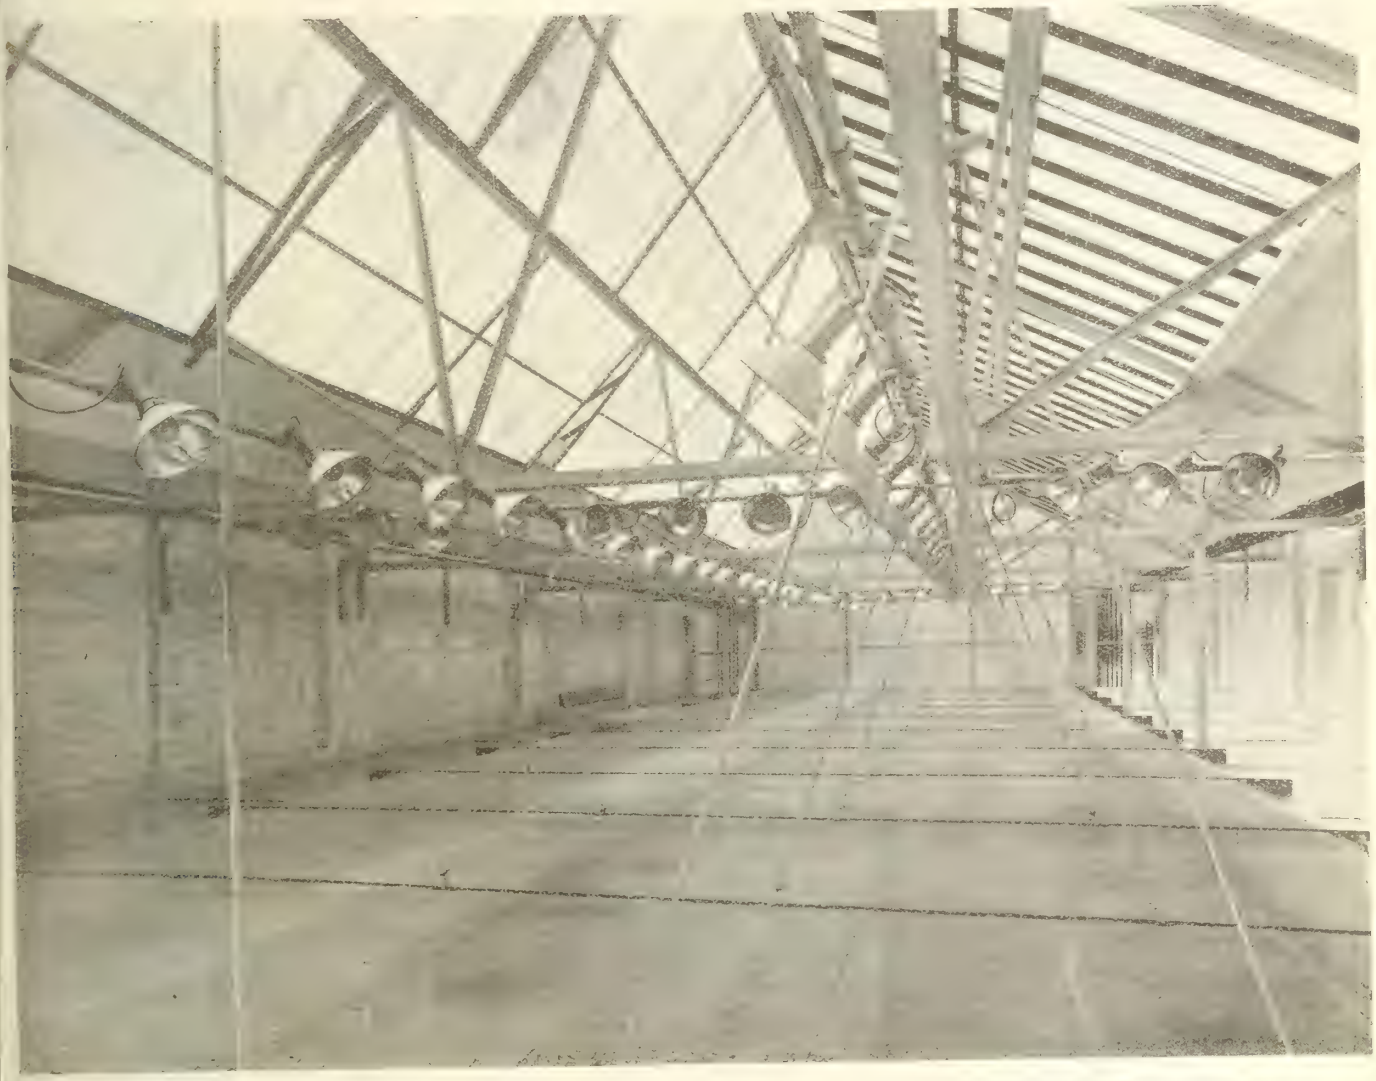
THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.



Bulletin No. 530 describes this instrument.

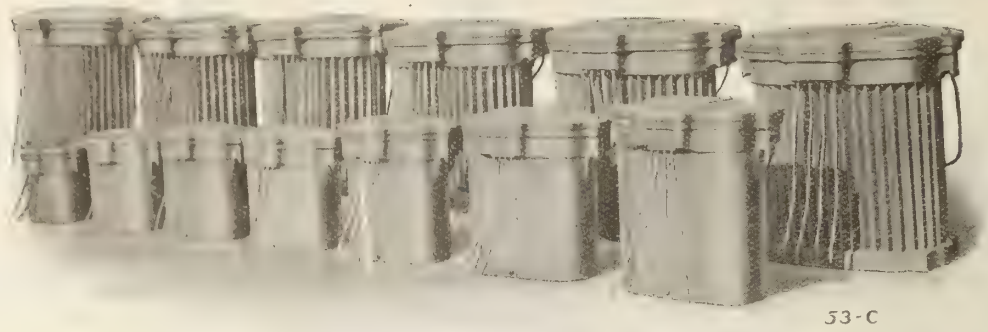
Lightning Protection Demands a Quick Discharge

The addition of sphere-gaps to electrolytic arresters —an original and notable C-G-E achievement — increases the speed of discharge and hence the protection afforded by the highly efficient electrolytic arrester.

C-G-E Sphere Horn Gaps for 70,000-volt Aluminum Arrester.



Heavy impulse disturbances of steep wave front take the main (lower) sphere-gap which has *no resistance in series* giving a quick and free discharge. If an arc rises on this gap it breaks on the upper sphere-gap which has resistance in series, thus damping any oscillations.

Lightning disturbances take either of the two upper gaps, depending upon the steepness of the wave front. This combination of spheres and horns supplies the element of speed which is necessary for thorough protection.

Vol. 27 Toronto, July 1, 1918 No. 13

Montreal Tramways Commission Recognizes Justice of Fare Increase

The advance in wages and the high cost of materials have caused the Montreal Tramways Commission to raise the fares. The company submitted detailed information showing that the cost of material has risen from 12 per cent. to 700 per cent. in some instances. The Commission has decided that the old rate of 6 tickets for 25c and 8 workmen's tickets for the same money will be abolished, and that in what is called the uniform tariff territory the rate will be five tickets for 25c, with a cent extra for transfers, except from 5 to 8 in the morning, when transfers are free. The cash fare from 8 a.m. until midnight will be 6c, in addition to a cent for a transfer, while after midnight the cash fare will be 15c. School children will obtain 7 tickets for 25c, the tickets being available from 8 a.m. to 6 p.m., transfers free. Another schedule of rates has been fixed for districts outside the uniform tariff territory, these being generally 5c for local traffic, 10c after midnight, with the uniform tariff extra when passengers are carried into that territory. In some instances there is an actual reduction in fares from Montreal to outside points. In order to get over the inconvenience of paying for individual transfers, arrangements will be made to sell strips of transfer tickets.

In explanation of the decision, the Tramways Commission state: "The revenue to be derived from such tariffs are to provide tramways service at cost. The Tramways Commission, after a careful study of the expenditures incurred by the Tramways Company in previous years and taking into consideration the increase in labor and material, found it necessary to provide for a total revenue of approximately ten million dollars for the twelve months ending June 30th, 1919. This gross revenue exceeds the revenue of the year ending June 30th, 1917, by an amount of $2,500,000, during which period the fares averaged 4.11c per revenue passenger.

"The increased cost of wages and material, as well as the increased fixed charges due to additional capital required, brings up the estimated cost per revenue passenger to approximately 5.5c. This increase of about $2,500,000, is made up as follows:

(a) Estimated increase in wages for 13 months...	$750,000
(b) Deficit incurred since the putting in force of the contract until June 30th, 1918	400,000
(c) Estimated increased cost of material and supplies	1,000,000
(d) Additional fixed charges	280,000

Elimination of Unnecessary Shock

Winnipeg, Man., June 12th, 1918.

Editor, Electrical News:

While numerous bodies have from time to time promulgated rules for protection of property against hazardous methods of electric installation, it is only recently that any attempt has been made to grapple with the question of this danger to persons from such causes. Noteworthy efforts are, however, discernible in certain directions, such as those of the Hydro-electric Power Commission rules, which are a step in advance, and more especially the National Electric Safety Code, issued by the Bureau of Standards, Washington.

As illustrating one little point in above connection I enclose copy of a notice recently sent out by us to all manufacturers of electric ranges. There is, to my mind, no valid reason why women and children should be exposed to risk of shock in such ways as are spoken of, when they can be so easily protected. It is, I think, up to electrical engineers and plant superintendents to bring pressure to bear on this problem and insist upon the elimination of these needless hazards.

Yours truly,
F. A. Cambridge,
City Electrician.

Notice to Electric Range Manufacturers

While we have on several occasions drawn your attention to the necessity of placing the individual switches on electric hot plates and ranges on one of the "outer" wires of the three-wire feeds, and not on the neutral, we still find considerable carelessness in the observance of this requirement.

Illustrating the necessity for the above precaution I would point to two complaints recently received.

(a) Woman while wiping off top of range with a damp cloth complained of receiving shocks, although all element switches were "off" at the time.

(b) Woman picking up kettle and with other hand touching range body got shock although all element switches were "off." In this case there would appear to have been some substance accidentally bridging the kettle bottom and the element wire.

Both above cases were fortunately in districts where the neutrals are grounded, hence, the maximum voltage to ground would be limited, but it is evident that with ungrounded neutrals shocks of much greater intensity are possible. A fatal accident due to such a cause would not only be exceedingly regrettable, but would materially check the growing popularity of electric cooking.

May I count on your thorough co-operation in eliminating the above risk?

Chicoutimi Pulp Co. Expanding

The Chicoutimi Pulp Company, P.Q., announces that it has acquired a controlling interest of 11,150 shares in the Saguenay Light & Power Company, which operates an electric light and power system in the town of Chicoutimi and surrounding district. This company owns and controls valuable water grants on the Peribonca River, hydro-electric station on the Chicoutimi River, and two small hydro-electric stations on the Ha! Ha! River, the output of which is sold to the Ha! Ha! Bay Sulphite Company, Limited. This latter company controls through stock ownership La Compagnie du Telephone Saguenay-Quebec, operating over 1,000 miles of telephone lines in the vicinity of Chicoutimi and Lake St. John, and connecting with the telephone companies into the city of Quebec. It also controls through stock ownership Le Credit Municipal Canadien, operating a small electric light and power company, located at Rimouski, Province of Quebec.

National Contractors Association Convention

The eighteenth annual convention of the National Association of Electrical Contractors and Dealers will be held in Cleveland July 15-20, with headquarters at the Hollenden Hotel. The executive committee meetings will occupy Monday and Tuesday, and the convention proper will be opened at 10 o'clock, Wednesday, July 17. An interesting item on Wednesday's program will be a paper by L. K. Comstock, of New York, on "Scientific System of Wage Adjustment." On Thursday, J. R. Strong, past-president of the Association, will speak on "Organization," and W. L. Goodwin will describe the Goodwin Plan. On Friday, G. M. Sanborn, of Indianapolis, will read a paper on "How to Open a Retail Store." Another interesting paper will be "How an Electrical Contractor Can Become a Successful Retailer."

Montreal Employees Get Increase

After prolonged negotiations, the Montreal Tramways Company has come to an agreement with its employees as to advances in wages. The representatives of the men asked for a larger increase than is to be given, and as the company put forward a lower schedule, a compromise was agreed upon. The advance will involve an average increase of 20 per cent. of the wages bill of the company, or a total of $600,000. Motormen and conductors obtain increases of from 6 to 9 cents an hour, the new rates being from 31 cents an hour to 37 cents an hour. All other branches are included in the arrangement, including power house, linemen, rolling stock, car barn, construction, and bridges and building departments. The raises here are from 3½ to 13 cents an hour, switchboard operators and assistant engineers being the highest paid employees in the electrical department, with wages of 42 and 42½ cents per hour respectively. The linemen are paid 32½ cents per hour. Ten hours will constitute a day's work, with time and a half to be paid for all time over ten hours.

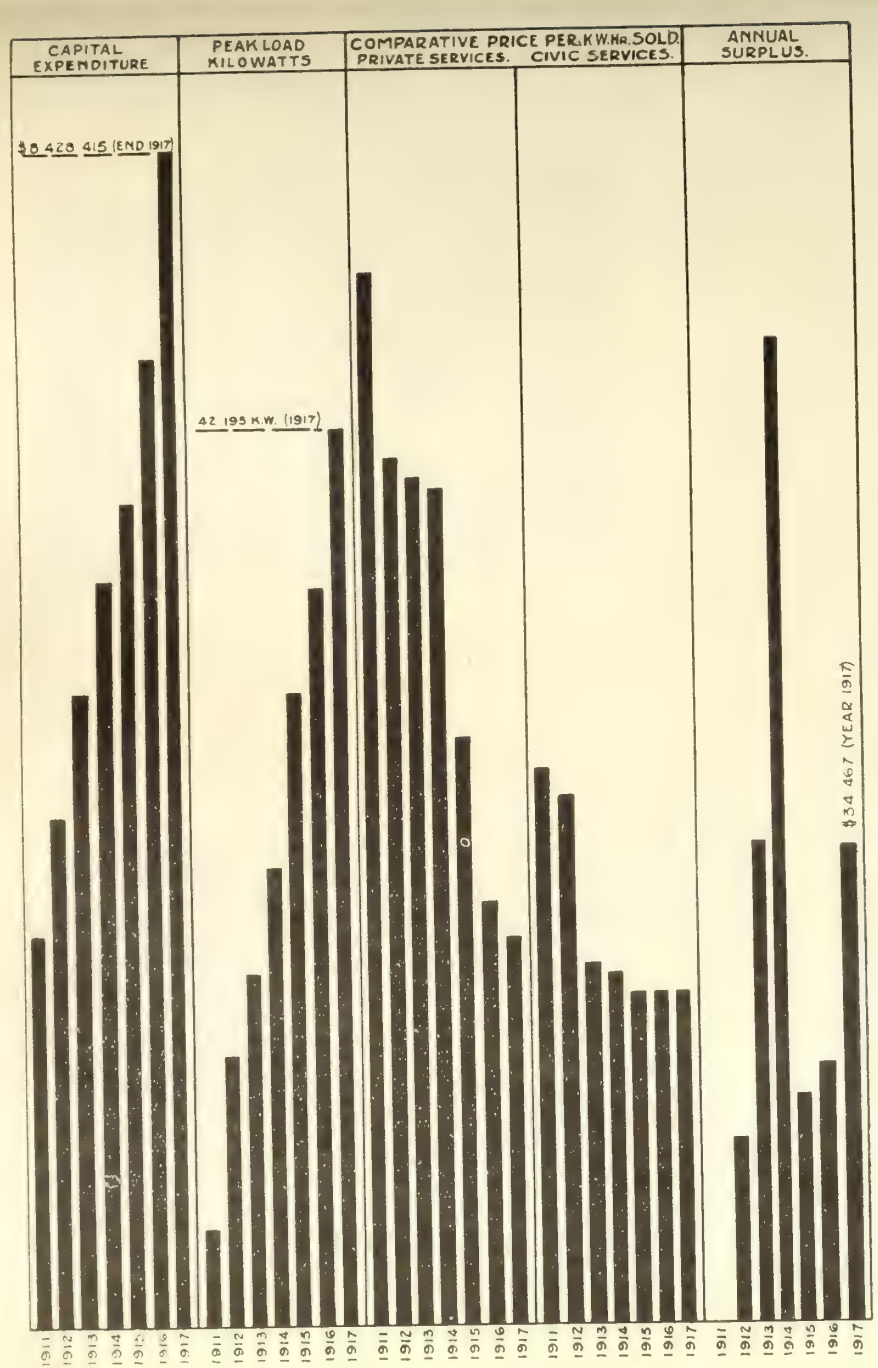
90 per cent. are granted rate increases.

Mr. Samuel Insull, President of the Commonwealth Edison Company of Chicago, recently said that out of 460 applications made by United States central station companies for increased rates in the year 1917 upward of 400 decisions were given favorable to an increase. Mr. Insull added: "The experience with those of us who have appealed to the properly constituted authorities to deal with the question of our rates gives me every confidence that, if we are diligent in the presentation of our situation to those properly constituted authorities, we are bound to get relief."

B. C. Contractors Association

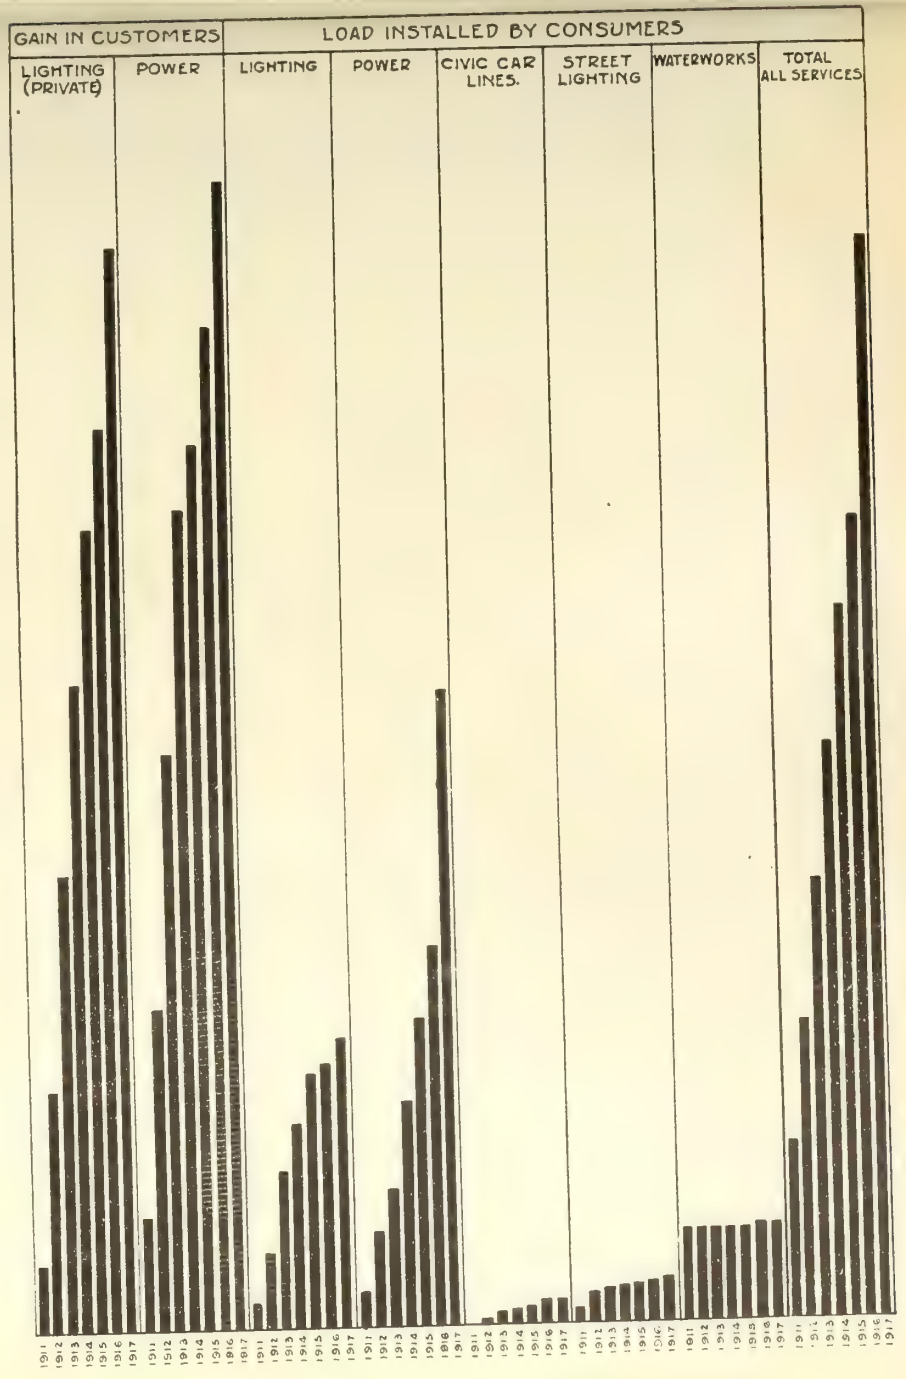
The B. C. Association of Electrical Contractors and Dealers held their regular monthly meeting at 406 Yorkshire Building, Vancouver, B.C., on the 4th instant. There was a large attendance, the chair being taken by the president, Mr. C. H. E. Williams. The business of the meeting consisted of the appointment of a secretary-treasurer, Captain W. J. Conway, 1575 12th Ave. W., Vancouver, B.C.; and the appointment of a special committee to make arrangements for the next (second) annual meeting, which is to be combined with a picnic to be held at Victoria, B.C., about the middle of August, when, it is hoped, Mr. Elliot of San Francisco will be present to repeat his kindness of last year, by giving the association the benefit of his advice on matters electrical. The president read his report on the California Convention, and was tendered a vote of thanks for his excellent work and report. Mr. Hayward was present as a delegate from the Victoria Association.

Toronto Hydro Seventh Annual Report



The Toronto Hydro-electric System have issued their seventh annual report covering the year's operations January 1 to December 31, 1917. The gross income for the year amounted to $2,049,383; cost of electric current, including expense of operation, management, repairs and maintenance, $1,294,023. This left surplus income on operating account of $753,360. Interest, depreciation and sinking funds required $720,893, which left a net surplus of $34,467.

The number of meters in use is now 50,461, an increase of 15 per cent. for the year. The connected load is 169,118 h.p., an increase of 20 per cent. The number of kw. hours sold during the year was 171,691,213, an increase of 24 per cent. Rates have been reduced as follows: Residence lighting 9.4 per cent.; commercial lighting 8.1 per cent.; commercial power 10.1 per cent. The total assets of the system now amount to $10,317,531.



The year's operations may be summarized from the general manager's report as follows: Increased income for the year, $343,200—roughly a gain of 20 per cent. over 1916; increased operating expenses, $66,600—an increase of only 12¼ per cent. Thus the revenue has increased at a considerably more rapid rate than has the cost of operation—and this in spite of a lower revenue per kw. hour sold.

A number of interesting items are mentioned in the general manager's report, such as the difficulties encountered due to power shortage; the inconvenience caused by their head office fire; the extension work necessitated for the supply of power to British Forgings, Limited; the decision to carry the System's insurance in connection with the Workmen's Compensation Act; for this laeter purpose a fund has been set up to which is credited a sum based on the cost of carrying the insurance if placed through an insurance company. The report also notes that a special sub-department has been started to deal with accident prevention along educational lines; the installation of synchronous apparatus for the correction of the system's power factor; the prosperity of the appliance department, in which the number of articles sold was in the neighborhood of 20,000, and, finally, the honor roll on which it is noted that during the year additional casualties include 2 killed in action or missing and 7 wounded. The commissioners have continued the grant, as before, to the dependants of the employees with the colors, the cost being debited to the year's operations.

Dr. S. S. Wheeler, President of the Crocker-Wheeler Company, stated at the Atlantic City convention that there are now forty blind men in the employ of his company, making good wages winding coils.

Toronto Hydro-electric System—Capital Expenditure, Peak Load, Comparative Rates and Surplus, year by year.

Toronto Hydro-electric System—Growth of business year by year, separate services.

Association of Municipal Electrical Engineers

Holds First Annual Convention at Niagara Falls—Inspection of Ontario Hydro Commission's 300,000 h. p. Chippawa Development

The first annual convention of the Association of Municipal Electrical Engineers of the Province of Ontario was held at Niagara Falls on Friday and Saturday, June 14-15, Mr. E. V. Buchanan, general manager of the London Public Utilities Commission, presiding. In his opening adress Mr. Buchanan remarked on the fitness of the location for the first convention of the Association of Municipal Electrical Engineers—the centre of Hydro-electric power for the province and where so great a reserve of water-power still awaits development. He did not think any group of electrical men on the globe had a greater heritage than we in Ontario, and in this connection he coupled the name of Sir Adam Beck, whose recognized ability, tireless as it was keen, was chiefly responsible for the development of the whole great project. The President regretted that a number of the municipalities had not yet joined the Association and urged that each member should become a recruit in explaining to these municipalities the advantages to be gained through membership.

Brief reports were presented by the secretary, treasurer and the officers of the standing committees. These indicated that the Association was in a most healthy condition, both as regards members and finances. The various standing committees, for the most part, had little to report on account of the short interval that had elapsed between their election to office and the present convention.

Amendments to Constitution.

One of the first amendments to come up for discussion was that regarding the advisability of including manufacturers as members of the Association. A keen discussion by Messrs. Yates, Shearer, Ireland, Kribbs, Lines, Leacock, Phelps, Chase and others, resulted in the adoption of a motion to the effect that an annual fee of $10.00 be charged and that manufacturers should consider themselves free to send as many representatives as they wished. The discussion rather tended to favor a grading of the fee, but it was felt that this could be left for further consideration at a later date.

Another amendment to the constitution related to the expenses of the members of the executive committee to the various meetings in Toronto and it was finally decided that it would be fair that delegates should charge their railway expenses to the Association and their other expenses to their municipalities on the supposition that the members would be able to combine with the business of the Association a certain amount of business for their own municipalities.

Another important amendment dealt with the representation of the various municipalities on the executive committee of the Association, the province being divided into sections, each electing a member.

The President then introduced Mr. H. F. Strickland, who read a paper on "The Evolution of Electrical Inspection in Ontario."

Discussion on Mr. Strickland's Paper.

There was a considerable amount of discussion and criticism of the rules and regulations of the Commission, many of the objections doubtless being well taken. It was pointed out by Mr. Strickland, however, that the Fire Underwriters' Association absolutely controls the situation and they are guided by the National Code. Mr. Strickland further emphasized the fact that this National Code is the result of most careful deliberation of the various electrical organizations of the United States, and if they felt that these regulations were in the best interests of the electrical industry at large we could probably not do better than follow in their footsteps. Mr. Scott asked Mr. Strickland to give the association some ideas on the evolution of electrical rules, and Mr. Strickland, at some length, described the various phases of discussion and consideration through which these rules must pass before they become law.

As the outcome of Mr. Strickland's paper, and the dis-

President E. V. Buchanan, London.

Secretary S. R. A. Clement, Toronto.

cussion which followed, a motion was carried requesting the Rules and Regulations Committee of the Hydro-electric Power Commission to allow a representative of the Association to be added to that Committee. Mr. Scott, who introduced the suggestion, emphasized the fact that the men in the field were more closely in touch with the requirements as regards rules and regulations than the Hydro men themselves could possibly be and, for this reason, they should have a representative on the Committee. Mr. Strickland favored the suggestion. A representative will be named by the chairman of the Rules and Regulations Committee of the Association.

Enquiry was made as to the outcome of the resolution previously submitted to the Hydro Commission asking that the name of the Inspection department be changed so as to omit the word "Hydro." As the secretary reported that no decision had ever been given on this point he was instructed to write the Commission again to urge that action be taken immediately.

"Factory Lighting"

An interesting, illustrated paper on "Factory Lighting" was presented by Mr. H. H. Madgsick, of the Engineering Department of the National Lamp Works of the General Electric Company. A hearty vote of thanks to Mr. Madgsick was moved by Mr. Kribbs.

On Friday evening the Association supper was held in the restaurant of the Administration Building of the Queen Victoria Park Commissioners, at which some 160 delegates were present. The chairman dispensed with unnecessary toasts and introduced Mr. Fred W. Field, H. M. Trade Commissioner, of Toronto, who spoke on "Overseas Trade." Mr. Field explained that the relationship between the colonies and the Mother Country was being more closely cemented as the various units of the Empire realized one another's resources, and in this respect Canada had come in for a great deal of valuable publicity. At the present time a very keen interest was taken by the Mother Country in Canadian trade which after the war would doubtless develop, if properly handled, to tremendous proportions. With this end in view the number of trade commissioners had been increased, Canada now having four, Mr. Field himself representing the Province of Ontario.

Mr. Geo. C. Rough, president of the Packard Electric Company, followed with an intensely interesting address on his experiences during "Thirty Years as an Electrical Salesman." Mr. Rough deprecated the idea that salesmen are born and not made. Of course a good salesman is all the better for having natural tact and ability to size up the customer at first glance, but success in selling is very largely a matter of hard work, long hours, and the faculty of arousing the interest of the customer through an appeal to one or other of his personal hobbies. A description of the visit of Joe Fissette to an electrical convention in Quebec City was the climax of a thoroughly enjoyable half-hour.

On Saturday morning Mr. J. F. S. Madden, sales engineer of the Hydro-electric Power Commission, delivered an address on "Sales Service." Mr. Madden discussed a number of interesting points which resulted in considerable discussion. One of the points about which considerable interest centered was that of a central purchasing department and, in connection with it, the action of manufacturers combining together for the purpose of securing better prices. Mr. Madden pointed out that in the United States the power of manufacturers to fix prices will probably soon be legalized and the tendency appears to be in the same direction in this country. A number of the delegates considered that a centralized purchasing department was not without its disadvantages. The larger municipalities did not stand to profit as much as did the smaller. The chief objection to such an arrangement, however, seemed to be that by placing a very large order with one manufacturer, competitors in this particular line were for the time being greatly inconvenienced and, so, unable to keep their organizations together. At the same time the one manufacturer who had obtained the order would be over-driven and probably unable to make delivery. If the order were given to another manufacturer the next time this condition would simply be reversed. In Mr. Madden's opinion it was largely this practice that had driven the manufacturers to combine for self-defence. Unless it were possible for a central purchasing committee to distribute the orders fairly evenly it appeared to be the consensus of opinion that municipalities had better be left to do their own purchasing. Delegates who participated in the discussion included the President, Messrs. Yates, Sifton, Coleman, Kribbs, Phelps, Shearer, Fisk and Chase.

Synchronous Motors.

Mr. M. J. McHenry, manager of the Hydro-electric System, Walkerville, read a paper on "Applications of Synchronous Motors." Mr. Leé, of the Toronto Hydro System, discussed Mr. McHenry's paper at some length as did also Messrs. Lines, Ireland, Sifton, Yates, Kribbs, Heeg and Scott. The opinion was generally expressed that the customer should be held responsible to a greater degree for the correction of power-factor. Mr. Lee thought a little education would go a long way in this direction. It was pointed out that many customers are now charged on a power factor basis—that is, they are penalized if their power factor is poor, or bonused if it is particularly good. This seems to be the fairest method of adjustment for everyone concerned and it has quite frequently been found possible to correct the trouble without resorting to the installation of corrective apparatus.

Resuscitation.

Mr. Wills Maclachlan, safety engineer, Toronto, gave a demonstration of resuscitation on two hydro linemen. Mr. Maclachlan has practically organized the whole province in resuscitation work and accident prevention, both for the Hydro-electric Power Commission and for the private companies, and a noticeable decrease in accidents is reported. Evidence of his good work is shown on every hand.

The Saturday session concluded with a brief description of the Chippawa development of the Ontario Commission by Mr. H. G. Acres, chief hydraulic engineer. Mr. Acres outlined the various schemes that had been considered, explaining the advantages of the route finally adopted. Following Mr. Acres' discussion the delegates were driven by motor over the twelve-mile route and given a chance to observe actual operations. A brief description of this development work appears on another page.

Municipal Delegates

Oswald H. Scott, Belleville; G. E. Chase, Bowmanville; Geo. Ostrander, John Spiers, Brampton; W. P. Catton, Andrew McFarland, Brantford; Royal Quick, Brighton; W. S. Russell, Campbellford; J. E. Comfoot, Cannington; J. G. Jackson, Chas. E. Clements (Mayor), Chatham; H. B. Chant, Clinton; J. E. Skidmore, Cobourg; E. J. Stapleton, W. B. H. Patton (Mayor), S. Burnside, Collingwood; Charles Eberlee, Dresden; Geo. E. Whiton, Dundas; R. Elliott, Galt; V. F. Hunt, Gravenhurst; John J. Heeg, M. W. Wheeler, Guelph; E. I. Sifton, W. H. Childs, Hamilton; M. E. Jardine, W. D. Scott, Hespeler; H. G. Hall, Ingersoll; S. A. Saylor, Kenora; V. S. McIntyre, Geo. Lippert, Kitchener; E. J. Hartrick, Kingston; C. J. DeBatts, Leamington; W. E. Reesor, Lindsay; E. V. Buchanan, A. C. Hunt, G. W. Blay, London; W. R. Savigny, James Rennie, Merritton; J. S. Milliken, Midland; A. C. Clemens, J. C. Grosch, Milverton; Thos. E. Bell, Geo

Stevens, Meaco; Charles A. Walters, Napanee; Geo. Morley, New Hamburg; J. W. Cook, New Toronto; J. W. Bayliss, C. L. Foster, Niagara Falls; W. Daykin, Norwich; A. T. Hicks, Oshawa; J. R. McLauden, A. F. Armstrong, Owen Sound; H. O. Fisk, Peterboro; G. W. Currie, Petrolia; V. B. Coleman, Port Hope; C. S. MacKenzie, Preston; J. E. B. Phelps, Sarnia; H. F. Shearer, Geo. B. Frost, Smith's Falls; P. B. Yates, F. M. Sewos, St. Catharines; E. A. Burgess, F. E. Welker, I. B. Rutsacher, St. Jacobs; E. H. Campbell, J. J. Roberts, St. Thomas; R. H. Myers, Stratford; E. R. Smithairn, Strathroy; J. E. Techoe, Tilsonburg; R. H. Martindale, Sudbury; H. H. Couzens, E. M. Ashworth, R. G. Lee, W. C. Burch, C. E. Schwenger, A. W. J. Stewart, J. B. Kitchen, C. W. Fatt, Wm. F. Kelly, Toronto; W. J. McHenry, Walkerville; J. R. Forbes, T. C. Savage, Waterword; Geo. Grosz, Waterloo; H. E. Timmerman, Welland; A. G. Pierson, F. G. Cousins, Weston; O. M. Perry, Windsor; W. J. McIntyre, Whitby; J. G. Archibald, Woodstock.

O.M.E.A. Delegates—W. K. Sanderson (St. Thomas), W. Ellis (Hamilton).

Associates—F. A. Gaby, J. S. Parker, S. L. Eisenhoffer, Gordon Kribbs, G. F. Drewry, G. J. Mickler, R. M. Bond, E. R. Lawler, A. G. Lang, J. N. Wilson, J. H. Caster, J. J. Jeffery, L. G. Ireland, S. R. A. Clement, R. C. McCollum, H. J. Surtees, F. T. Stocking, J. F. S. Madden, W. M. Bostwick, Wills Maclachlan, W. H. Mulligan, K. R. McClellan, E. T. Brandon, B. O. Salter, H. C. Don Carlos, H. F. Strickland, W. P. Dobson, Hydro-electric Power Commission of Ontario.

Visitors—J. A. Shand, J. F. Hill, W. H. Christie, H. A. Burson, Canadian Crocker Wheeler Co.; J. W. Taylor, A. C. Johnston, W. M. Andrew, Canadian Westinghouse Co.; W. R. Greenshields, Canada Wire & Cable Co.; H. E. Hunter, F. A. Mahoney, C. H. Beavis, A. S. McCordick, B. F. Selby, Wm. A. Bucke, A. G. Cooper, W. G. Young, Canadian General Electric Co.; S. L. B. Lines, Chamberlain & Hookham Meter Co.; W. S. Ewens, H. J. Hammond, Northern Electric Co.; R. H. Starr. Geo. D. Leacock, Moloney Electric Co.; Geo. C. Rough, Packard Electric Co.; C. C. Bothwell, Laco-Phillips Company; Fred W. Field, H. M. Trade Commissioner; H. G. Acres, Hydraulic Engineer, H. E. P. Co.; S. L. Weber, St. Jacobs; S. Stroud, Hamilton; C. N. Farrow, J. J. O'Hearn, Toronto; L. M. Bradley, St. Thomas; K. M. Sorrich, Chatham; C. V. Edmonds, V. K. Stalford, Geo. W. Howse, A. T. Smith, wiring inspectors, H. E. P. Co.

The Evolution of Electrical Inspection in Ontario

By Mr. H. F. Strickland

Electrical Inspection in Ontario dates back approximately to the year 1892, as near as I can recollect, a year or two after what was then known as the Toronto Incandescent Electric Light Co., was established. At that time I was connected with the old Incandescent Company under Senator Frederic Nicholls and had a good deal to do with the obtaining of contracts for the installation of wiring and motors in Toronto, the estimating on these jobs and looking after this part of the work generally.

Electrical inspection at this time was introduced by the Fire Underwriters as a precautionary measure and what inspection there was then was in charge of Mr. A. Bruce Smith, then Superintendent of Construction for the G.N.W. Telegraph Co., and now Manager of Telegraphs for the Grand Trunk Pacific Railway. The peculiar part of the situation in those days was that inspectors carefully and in due form certified to what we now would just as carefully condemn. This was not, of course, through any fault of the inspectors. In those days I can distinctly remember the lay-out of wiring jobs and often think how different they were from the present day and more often what would occur in Ontario to-day if wiring was still performed in the same manner. No doubt you have all used the argument and had it used in turn upon you, at least I know we have, that because a wiring installation as performed twenty years ago did not always burn the building down the first night it was connected up, that it is just as good as the work done to-day and that there were not more fires then than there are now. This statement may sound perfectly logical to anyone who wants to believe it without knowing the facts.

In those days I knew almost every installation which was connected up in the City of Toronto, and practically every wiring job which was being done in the same city. Toronto was at that time a city of considerable proportion and population and it was not very long after that when there was a very large building boom. Nevertheless, when there were three or four wiring jobs being done at the same time, things were what we might say "humping."

In the year 1892 and the two or three years following, wiring was installed in a variety of ways, which to say the least would be startling and interesting to behold at the present day. I can at the moment clearly see, with my mind's eye, the wiring in a building in Toronto which has since been pulled out which consisted of rubber-covered wire threaded through the joists with gimlet holes and then tacked on to the brick ways between the strapping with pieces of tape and a nail, much in the same way as a Virginia Creeper would be trained up the side of a house. When these wires, or electric creepers, were carefully tacked on the walls they were then covered in with fresh wet plaster. These circuits were ostensibly protected by wooden cutouts dipped in paraffine with open fuse wire and then mounted in wooden pockets in the walls, strictly without asbestos.

The chief form of protection and general finish in most wiring was a good daubing up with P.&B. compound, which was commonly known as "stink." So long as a wireman could daub a lot of P.&B., on the cutout box and generally daub everything up that did not look right electrically, it was generally considered a very good job.

The service equipment consisted generally of a piece of board nailed up some place handy; it did not make much difference whether it was in a clothes-closet, basement or attic. The service wires came in from outside through a couple of gimlet holes in the board and after being wrapped with tape they generally ran directly to the branch cutouts after passing through an Edison electrolytic meter. No doubt, theoretically this meter was the most accurate registering meter which was ever produced, but no doubt before the customer received his bill there were several inaccuracies which might creep in, such as the weighing of the elements and the recording of same in the books, and ultimately the computing of it in dollars and cents. Of course, we know that no one in the electrical business would think of increasing a customer's bill, but I merely point out what an easy matter it would be with meters of this description for someone to read these meters as high or low as was considered advisable or necessary.

When this meter was installed on the board, the meter board such as it was was likewise well daubed up with "stink" and the service was completed in due form.

The salvation of a great deal of the wiring in those days was undoubtedly owing to the high-class of wire used.

Rubber-covered wire was very superior, and I may say vastly superior, to the wire which has been used in Ontario up to the last year or two, in fact rubber-covered wire became a standing joke and I have heard it stated on good authority that one manufacturer made the broad statement that he was making rubber-compound for wire without using any rubber. The new Code rubber-covered wire which is required to-day, is however, very much superior to that which has been used during the past ten or fifteen years, but I doubt very much whether it is as good as the rubber-covered wire which appeared in the early part of 1900.

It does not require a very great amount of abstruse calculation to answer the question touched upon a few moments ago as to why there were no more fires at that time than there are to-day with all our modern improvements; one has only to consider the ratio as between the amount of current used then and at the present time, to answer this question. In those days the large percentage of electric light, especially in the large cities, was direct current, and the question of break-down between high and low tension and the grounding of secondary did not enter very largely into the question at all, until some few years later and where there was one building wired up in those days there are many hundreds to-day.

It now seems an opportune time to pass some comments on the Electrical Inspection of the past to make it very plain that I do not wish to reflect in any way upon the past inspection or anyone connected with it. One might as well compare the efficiency of a soldier with the old flintlock musket and the marksmanship of a crack shot armed with a modern Enfield rifle. The present inspector is vested with Rules and Regulations which are the outcome of past experience, and now enjoys a legal status which did not exist in those days.

The Fire Underwriters, who inspired the first production of an electrical code, did not do so out of love for their fellow men but as a protection to themeslevs and no one should blame them for having so done. It seems to me that when an aggregation of companies is expected to pay for fire losses that they have a right to know what they are paying for. The motive of the Underwriters' Regulations has always been the protection of buildings against fire, and they did not pretend to make regulations for the protection of life, although there are a certain number of rules in the National Code which have been adopted for that purpose, but only recently.

A few years ago, practically the only inspection which was carried on in the North American Continent was that of the Underwriters' Inspection Bureau in the different cities and towns of Canada and the United States. This has been followed in recent years by some of the cities, where civic ordinances were passed causing Electrical Inspection to become mandatory.

In most cases the Underwriters objected to anyone doing electrical inspection but themesleves. Possibly they are to be excused for this attitude, owing to the fact that they are paying for the losses. I know that at the present time the Fire Underwriters frequently hand me some comments to the effect that our electrical inspection is far from being as effective as it should be, and it was only during the last month that I was told by the chief official of the Underwriters' Association that we are unable to carry this inspection as far as we should and in many respects it is a failure. This, of course, was said to me in an apparently friendly spirit and no doubt this body sincerely believes this to be true.

This Would Satisfy the Underwriters.

There is only one system of Electrical Inspection which will ever satisfy the Underwriters (and this is said with the best feeling and with all deference to them) and that is a system of inspection which will not allow any electrical work to be installed in buildings at all, nor any electric current to be supplied thereto and the only electric light which should be permitted in buildings to be in the form of portable flashlights. Such a condition would be ideal for the Fire Underwriters as there would be positively no fire losses from electrical causes.

Commenting further on the attitude of the Underwriters towards this inspection, I think the chief trouble is that they have not really seriouly analyzed the work of the Inspection Department or made a fair comparison as between what is being done now and what was done in the old days. Having been Chief Electrical Inspector for the Canadian Fire Underwriters Association for a period of five years I think that I can justly claim to know as much about the subject as anyone else. As a matter of fact, I was the first inspector employed by the Underwriters who was called upon to devote his whole time to organizing and enlarging the whole system.

When I took over Electrical Inspection in Toronto some twelve years or more ago, the entire work was being carried on by Mr. Smith, who was Superintendent of Construction for the G.N.W. Telegraph Co. No one who knows Mr. Smith would say anything about him except what would be favorable from every point of view. Mr. A. B. Smith enjoyed the respect and admiration of everyone who knew him and undoubtedly if he had the opportunities which I have had and had devoted his whole time to Electrical Inspection he would have made a great success of it and my effort would have looked very small in comparison. At that period, however, Mr. Smith's time was very largely devoted to the work of the Telegraph Company and as there was no law requiring inspection, no one was obliged to have work inspected. Such conditions tended to produce chaos. For instance, no wireman could tell whether to figure on a good job or a bad one. The general result with the wiring was that a good contractor wished to do a good job and only did so when he had the work at his own price, or after having ascertained who was competing with him. If only two or three good wiremen were asked to figure on the job there was some chance of getting a fairly good job done, but if two or three cheap men had a hand in the pie, chances were that the job was a poor one with no guarantee that it ever was inspected, in fact it often was not. As soon as it was ready (and often before) the electric light company would issue a service certificate.

I can remember in the early days of the Toronto Hydro where rows of houses were being built, it was often a race between the Toronto Electric Light Co., and the Hydro for service and I have seen one or the other of these supply authorities install services in a whole row of houses before they were lathed and plastered, and put the meters in and turn on the current. This was a very undesirable state of affairs, and it was a wonder that there were not a number of people killed or a number of fires resulting from this mad rush for current regardless of the safety of others.

I distinctly remember one case where a couple of Italians were digging in the cellar of a house when one of them happened to touch the main switch. He got a nasty shock and out of retaliation he took his spade and smashed the meter and everything else to pieces.

Companies Mixed Their Meters.

Things became worse and worse and I have known cases where the companies forgot whose meters were whose. I remember another instance where a Hydro meter was in a house and was connected up to the Toronto Electric Light Co's. service wires, so that one company was deriving a revenue from the other company's wires through their own meter. Jumpers around meters to shut them out altogether

was also a very popular past time in those days and no one [illegible] deprived of service owing to a blown fuse so long as there was a wire nail or a pant button not working. But this was not all. There were a few legitimate wiring contractors in Toronto and vicinity and a score or more of people doing wiring (with the accent on the **doing**); and not only doing the wiring but also the people for whom they were doing it. You can judge to what an extent this was carried when I tell you that I know of a row of houses in which the wiring was let to some itinerant contractor and the builders, after having paid this contractor about 85 per cent. of his total contract (of course without inspection) suddenly discovered that there were no wires in the houses at all, that the contractor had merely wired up to the outlets and succeeded in some way in having it lathed over before his little joke was discovered. In other words, the woods were full of carpet-bag contractors, boys and other amateurs who considered themselves quite competent to wire up anything as they felt disposed.

I have in this paper so far alluded chiefly to the conditions in Toronto. Ths is owing to the fact that Electrical Inspection in Ontario was very largely a matter of Toronto. There was a little inspection done on the side, consisting of the local managers of the G.N.W. Telegraph Co., in Hamilton, Brantford, and Kingston, and only after I took over the Underwriters' inspection there was an inspector appointed in the City of Ottawa.

To make a long story short and to make a fair comparison of the conditions which exist to-day as against those existing in the days of Underwriters' inspection, one has only to state that to-day in the Province of Ontario there is not a square inch of territory left uncovered. Electrical inspectors are now duly appointed and have been carrying on their work in the different districts extending from Windsor to Ottawa and from the very southernmost part of the Niagara Peninsula right up to Kenora, Sudbury and Timmins on the north.

Touching on Electrical Inspection as it is to-day one of the most important requirements, in fact I believe that it is the very backbone of the whole inspection system, is the permit, which is required before the work may be performed. If the law merely called for an application for inspection on all work as performed or that had been performed, it would not begin to be as effective as the permit. Any itinerant or other doubtful wireman could always make the excuse that he intended having the work inspected. This excuse could be raised a day, a week or if necessary a year after the work was done, but the permit to perform the work clinches the argument at the start and I believe it has been the means of weeding out more doubtful and inferior wiremen than any step which has been taken, and I am glad to say that the Commission has supported us in enforcing this requirement.

Activities of the Inspection Department.

The energy of the Inspection Department has not been solely devoted to the inspection of new work either, as the following figures will show: From June 1st, 1917, to May 11th, 1918, the sum of $241,936.46 has been expended by electric light consumres, owners of buildings and others responsible, in removing dangerous and doubtful wiring and these figures would have been much greater were it not for the abnormal price of labor and material.

In addition to this we have annual contracts with 455 manufacturers and other concerns which entitle these parties to a monthly inspection of their works. These monthly inspections have proved so satisfactory that the larger proportion of them were renewed this year and such as dropped out have been replaced with new ones. I have not heard of any inspection department on this Continent which carries on a system precisely the same as this, nor do I know of any department where the permit system is as strictly enforced or as generally uniform as it is in this province. There are a few departments in the States where they have local by-laws, each with its peculiar differences in law and interpretation but I do not know of any district as vast as Ontario which is under one administrative head and which is under the same uniformity of law and interpretation as this.

Nor are we behind the times in our methods of construction. In many up-to-date inspection departments in Canada and the States the open switch and service equipment is still accepted as o.k. I have seen electric services in many cities in the States and Canada and do not know of anything which is more up-to-date, more finished looking, safer or modern than our iron-clad service equipment, especially when hitched up to an A-1 conduit installation.

At this juncture I would hint at an innovation which is likely to materialize in the very near future, in fact before this paper is read it may have become a reality, and that is a new method which has been submitted to the Commission and approved, covering the installation of electric fixtures. This system does away at one sweep with all the objections to the hanging of and wiring to the fixtures at the outlets. Of all the dirty jobs in the wiring of a house, the hanging of a fixture is the meanest to be found. Anyone familiar with house wiring knows that under the fixture canopy is the weakest spot in the job. Often we find here a mixture of crowfeet, joints in wires and screw nails, all jumbled up in a heap right at a hole in the ceiling where shavings and other inflammable material accumulate and where a fire can be beautifully encouraged with the draught which is so common between joists in any building.

Result of a Transformer Breakdown.

I remember quite clearly an incident in a large city in Ontario where a transformer broke down one afternoon and something like twenty-two fires developed in a few city blocks supplied from this large transformer.

I examined a number of these installations and in nearly every case the fire broke out under the fixture canopy. The new method referred to will enable a school child to install the ordinary electric fixtures in a house with a twist of the wrist. The brackets can be put in as easily as an electric iron can be attached to a receptacle and the only difference with the pendants being the assistance of a step ladder, and fixtures can be removed just as easily and quickly. In order to make this method of installing fixtures possible and to facilitate the adoption of same, the Rules and Regulations of the Commission will be amended to call for outlet boxes on all outlets in connection with knob and tube work, now only a recommendation. The added cost of an outlet box is a small matter and the first installation of fixtures on a job will more than pay the entire cost and it will be a gain each time fixtures are put in and taken down.

The enforcing of electrical inspection sometimes appears different to the inspected then it does to the inspector and we meet with all kinds of people and all kinds of arguments. In all fairness to the Electrical Inspection Department it must be conceded that in order to carry on a system of inspection it is first of all necessary to have a set of Regulations and by the very nature of electric construction it is demonstrated that they must contain a great variety of detail and figures. There are times when the enforcing of a Regulation may appear arbitrary. On the other hand, a little laxity may appear to the other fellow as rank favoritism. This depends entirely upon the attitude of the parties interested and whether they are the inspected or the inspector.

We have endeavored in every possible way in enforcing

these rules to keep the new work strictly up to the Rules and Regulations. This seems to be the only way to give ultimate satisfaction and I think I can safely say that the majority of the best wiring contractors and parties interested in Ontario appreciate this fact. By so doing, all contractors and others are placed on a fair basis when estimating on work, and if not now, perhaps sooner or later people will feel that they have some measure of protection when letting contracts for wiring when they call for the production of the inspector's certificate.

Inspectors are Experienced Wiremen.

Neither the writer nor any of the inspectors on this staff claim to be a finality on everything electrical,—far from it. I do claim, however, that every man holding a position as electrical inspector on the Commission's staff has been a well-trained journeymen wireman before he commenced his training as an inspector, in fact the large majority of these inspectors served many years in the electric wiring trade with the largest and best-known electric concerns in Canada and the States, and not only were they familiar with the trade itself but were well posted on the tricks of the trade.

There is an old saying that "it takes a thief to catch a thief" and the varied tricks of shady wiremen and contractors are quickly detected. Not only must inspectors keep abreast of the wiring trade and the development of this art but they must keep thoroughly familiar with every fitting which is used, just why it is used and whether it is real or imitation, and incidentally keep track of the doings and sayings of all the different wiremen and their peculiarities.

We are frequently confronted with electrical installations which are almost in accordance with the Rules. This is a very distressing condition because if one person is permitted to get away with work that is almost right, the next contractor is prone to take advantage of it, and so on, all down the line and eventually the rule which has been almost broken will become very much dislocated and openly violated. in the long run.

It would take a great deal of time and space to intelligently record and put into interesting reading form all the idiosyncrasies of the Electrical Inspection business. There are many things we would like to speak of and some things for obvious reasons we cannot, and in touching on these questions of the tricks of the trade we do not like to pass over the point without speaking in no uncertain terms of appreciation of the co-operation we receive from regular bona fide contractors and their affiliated organizations.

We have tried in every way to improve the wiring conditions and bring electrical construction and inspection up to a high and sane standard in this province and we hope to continue to do so, as long as we receive the support which which we now do from the Commission and the co-operation which is enjoyed from the contractors and others.

With the foregoing remarks I will bring this paper to a close. If my subject has proved at all interesting and there is any discussion to follow I would be glad to hear any suggestions or questions which may arise and in concluding I can only say that Rome was not built in a day and I think I can fairly claim that our efforts in developing this inspection work in the Province have met with at least some measure of success and that no stone will be left unturned to further improve conditions. All I ask is that hasty judgment or destructive criticism be avoided.

The Commercial Application of Synchronous Motors

By Mr. M. J. McHenry

The theory of the synchronous motor in its application as a power factor corrector, is familiar to every engineer, and is not greatly complicated. It is not the purpose of this paper to discuss this theory or to call attention to the most approved methods of design calculation. An attempt will be made, however, to point out the principal characteristics of this type of apparatus which make it applicable to certain classes of service, and further to discuss the industrial use of these motors in relation to the central station and its customers. A few remarks will also be included on the selection of the proper motor for different classes of load.

The discussion of the characteristics of synchronous motors can probably best be accomplished by comparison with those of the well known polyphase induction motor. Almost everyone to-day, is more or less familiar with the induction motor and its operation, since this type of motor has been almost universally applied wherever electric power supply is available. In considering the industrial application of synchronous motors, such a comparison should be made with reference to the operation of the apparatus. This would call for a comparison covering starting characteristics, ruggedness and durability of the equipment, simplicity of construction, efficiency and freedom from interruption of service.

Synchronous Motor Maintains High Power Factor.

The principal characteristic of the synchronous motor, and the one which gives it a commercial value, is its ability to maintain high power factor and, if necessary, to be used to improve a poor power factor due to other equipment on the system. For any given load, the induction motor operates at a constant power factor which is always lagging—the lighter the load, the greater the lag. The power factor of the synchronous motor, on the other hand, is always within the control of the operator and can be made unity, lagging or leading at will, by manipulation of the field rheostat. This feature is of particular importance to the central station today, especially where there is long distance transmission and heavily loaded lines, or where the feeder regulation is poor. It also becomes of great interest to the customer whose power factor is low and who is, consequently, being penalized by the power company. This ability to correct power factor calls for the use of the synchronous motor commercially, to increase the capacity on transmission lines which are operating under an overload in current due to low power factor, to increase the capacity of transformers similarly overloaded, to raise the power factor of isolated industrial loads and to assist in maintaining the voltage of feeders and transmission lines within proper limits.

The starting characteristics of the synchronous machine do not differ greatly from those of the induction motor, either machine drawing a heavy lagging current from the line if starting under its load. It must be remembered, however, that it is comparatively easy, in certain types of induction motors to so design them that they can come up to full speed with full load, and not cause a severe drain on the system. On the other hand, synchronous motors that can develop as good torque in starting up, are generally of quite special construction. Consequently, it is not possible to apply the synchronous motor to every service that can be taken care of by the induction motor. As the starting torque of the synchronous motor is usually obtained by means of amortisseur windings, similar to the squirrel cage winding in the rotor of an induction motor, it is possible to vary the

torque by modifying this winding. Theoretically, this is a practical proposition, but for various loads, it is prohibited by the commercial cost of the design required. It is of interest to note that widely different characteristics can be obtained by the use of different materials and methods of design in the amortisseur windings of a synchronous motor without serious detriment to the efficiency of the motor, since it always runs in synchronism under load. On the other hand, the induction motor always has a slip with consequent losses in the rotor winding, which losses are increased with an increase of the resistance in the winding. The starting apparatus required for both types of motors, is somewhat similar, but there is the additional complication, in the case of the synchronous motor, introduced by the d.c. field with its special exciter.

Simplicity an Advantage of the Induction Motor.

From a mechanical view point, there is no question but that the induction motor, with its absence of sliding contacts and its simply constructed rotor, lends itself to more severe service than the synchronous motor with its more complicated rotating field and auxiliary exciter. From an electrical standpoint, the induction motor still has its advantage of simplicity, since little auxiliary equipment is required for its operation and little attendance is necessary after it is once started. The synchronous motor, on the other hand, must have a separate d.c. exciter with rheostats, field switches, etc., and good operation depends largely on the degree of field excitation given the motor.

With regard to the possibilities in efficiency, the synchronous motor, in its nature, has the higher efficiency at the higher loads and the induction motor, at the lower loads, this difference being due to the energy required for excitation of the synchronous machine as compared with the rotor losses of the induction motor. In the synchronous motor, due to the larger air gap and the limitations in heat dissipation in the field coils, the excitation at "no load" is relatively high, but this excitation is not increased greatly at "full load." In the induction motor the secondary loses at "no load" are small as compared with those at "full load." In general, however, it is possible to obtain higher efficiencies with synchronous apparatus than with induction motors. As an example —let us compare the efficiencies of two machines of approximately the same size as shown in Fig. 1. This figure gives efficiencies for a sqiurrel cage induction motor of 250 h.p. capacity, 600 r.p.m., 2200 volt, 3 phase, 60 cycle, and also the efficiencies for a synchronous motor of 240 h.p., 600 r.p.m., 2200 volt, 3 phase, 60 cycle. Curve No. 1 gives the efficiencies for the synchronous motor at 100 per cent. power factor; Curve No. 2, for the synchronous motor at 80 per cent. power factor leading; Curve No. 3, the efficiencies for the induction motor, and Curve No. 4, the corresponding power factor for the induction motor. It will be noted that at full load and ¾ load, the efficiency of the synchronous motor exceeds that of the induction motor, while at the lighter loads, the induction motor has the advantage. It must be remembered, however, that at the lighter loads, the synchronous motor has the advantage of maintaining a high power factor, while the induction motor, has a very low power factor, as will be noted from the curve. Furthermore, the induction motor power factor is always exceedingly low compared with that which can be obtained from the synchronous motor. Extremely good efficiencies have been obtained with synchronous motors, the following being those obtained on actual test with a 250 h.p., 3 phase, 60 cycle, 4000 volt, 1200 r.p.m. synchronous motor for direct connection to centrifugal pump.

Full load	95.3%
¾ load	94.8%
½ load	93.4%

The efficiencies to be obtained with a squirrel cage induction motor of the same capacity and rating, would be as follows:

Full load	93 %
¾ load	92½%
½ load	91 %

From an efficiency standpoint, it would appear in general that better results can be obtained with the synchronous motor.

A valuable characteristic of the synchronous motor is the possibility of increasing its excitation in such a manner that the motor is not in danger of breaking down. It is well known that the maximum torque of the synchronous machine can be increased by over excitation. This increase in exciting current can be accomplished by means of a field regulator actuated by automatic relays, or in the case of motor generator sets, by series coils on the motor fields, excited from the d.c. generator armature. The maximum torque of the induction motor on the other hand, is fixed for any one machine, provided the voltage is constant.

It is well known that once a synchronous motor has fallen out of step, the excitation must be reduced or entirely removed in order to get the motor back into synchronism. This is sometimes used as an argument for the induction motor in cases where the line voltage is likely to be interrupted for a short time or drop to such a low value that the motors fall out of step. This argument is questionable, however, as should full voltage come on an induction motor at

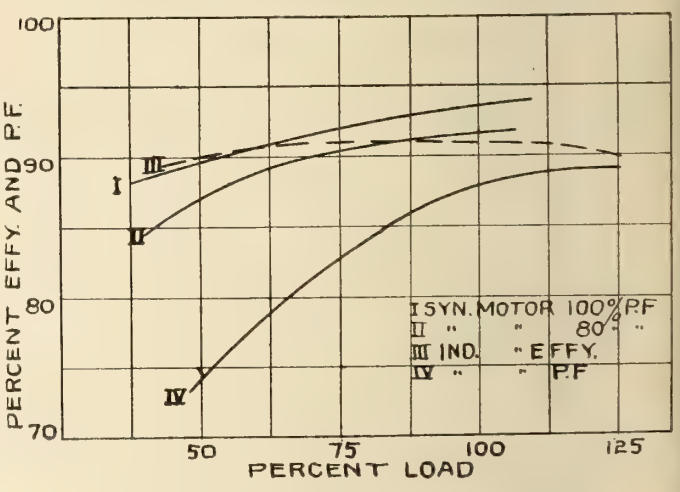


Fig. 1.

rest or running at low speed, the draught of current would be so great as to trip the oil switch and necessitate starting up in the usual manner. It is the general experience in practice, that synchronous motors behave much better under such conditions as partial short circuit, or even the dead short circuit to ground of one phase of the line running to the motor, than induction motors. This is due to the fact that the synchronous motor has its excitation supplied from an outside source and this excitation tends to raise the voltage at its terminals, rather than to reduce it when there is any cause at work on the lines tending to drop the voltage; and furthermore, to the fact that any given strength of field on a motor tends to maintain the ability of a motor to carry load when the potential back of the motor is reduced. On the other hand, in the case of the induction motor, any drop in voltage in the lines leading to the motor must result in a still greater reduction of the voltage at the motor and, consequently, an increased current to carry the load. This in-

creased current, in turn, results in a still further reduction of the supply voltage and consequent dropping out of step.

Before concluding the comparison of these two types of motors, it would be well to consider the question of torque characteristics, Fig. 2. This figure gives the comparative torque characteristics of 250 h.p., 1200 r.p.m., 60 cyc'e, 2200 volt synchronous motor and squirrel cage induction motor. The speed torque curve given for the synchronous motor can be taken as characteristic of this type of motor with squirrel cage winding of average resistance, or that most common in commercial machines. It will be noted that the initial torque of the synchronous motor, exceeds that of the induction motor but that the final or "pull in" torque of the induction motor, is much better than that of the synchronous motor. By using the curves of apparent torque efficiency, we note that for the same input, the torque of the synchronous motor is greater up to about 80 per cent. of speed. It then falls off rapidly, until at 90 per cent. of speed, it is not much more than one-half that of the induction motor.

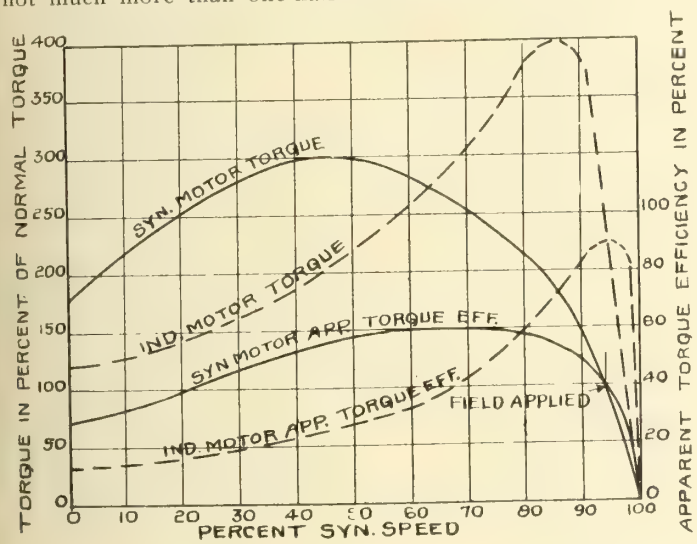

Fig. 2.

Beyond this point the synchronous motor torque is small in comparison with the induction motor until the d.c. field is excited at about 95 per cent. of full speed, when it rises abruptly to full torque.

In view of the foregoing, it is perfectly obvious that either type of motor has advantages which are peculiar to itself, proper consideration of which will enable the engineer to put the right motor in the right place. It is useful to keep in mind the broad distinction that the induction motors are poor and expensive at low speeds while they are exceedingly satisfactory and comparatively cheap at high speeds. Also the greater the capacity of the machine required, the greater the advantage of the synchronous motor in relation to first cost. It is evident that for extremely small applications of power the synchronous apparatus (except in a few isolated cases) has the disadvantage of extremely high first cost and complicated equipment and operation when compared with the induction motor.

It may be stated in general that the customer of a power company has little technical interest in the use of synchronous equipment, since it is more expensive than induction motor equipment, is not readily adapted to extremely small unit installation and is, even with the present design, less rugged and easy to operate. On the other hand, in the larger units, these points are of less significance and industrial application of synchronous motors can be made where relatively large concentrated power applications occur. This may sometimes be supplemented by, but is generally differentiated from, group and individual motor drives in a manufacturing plant. It will, therefore, be found that such applications will be made on large centralized equipment, such as air compressors, refrigerating machines, pumps, motor generator sets, etc., or in certain instances where there is one centralized power supply using mechanical distribution throughout the plant. An example of this latter case is the smaller milling concerns, where all the manufacturing processes are correlated and there is no diversity factor since all machines operate at load when the mill is in commission. This particular case gives an opportunity for the commercial application of synchronous machines more especially so as there is no requirement for frequent starting and stopping which obviously is not advantageous to the synchronous equipment.

From the standpoint of the consumer of power, the motive for the synchronous motor application is found either in a power rate favorable to unity power factor or leading load, in a sharing of the expense of initial installation by the central station company, or in a special rate lower than that for the induction motor service and offered by the central station in consideration of the improvement of distribution conditions which will prove advantageous to the central station company.

Almost all modern systems of charge for electric power are based on the maximum demand in conjunction with the kilowatt-hours usually in the form of a direct charge for power and another direct charge for energy or on a load factor distributed over a period of time. In the latter case the charge comes back to either a recorded demand charge or the rating of the connected equipment. Uusually a metered system of demand seems to be distinctly preferable.

If such a metered demand were based on the kilovolt amperes rather than on the kilowatts, the consumer has a distinct interest in maintaining the power factor as near to unity as possible. In the case where energy is supplied from a hydroelectric plant, over a long distance transmission line, this is the rule and the customer has an incentive to make synchronous installation of usually from ten to thirty per cent. of the annual cost of power.

When operating companies take account of the power factor of the customer's load in making their rates, it is to the customer's benefit to install condenser capacity and thus obtain the benefit of decreased power rates, if, by so doing, the saving in power cost will pay the fixed charges on the capital required, as well as the increased operating charges, due to the installation of such an equipment. Another instance of the value of the correction of the power factor alone would be in case the customer owns the step-down transformers and, due to the natural growth of this plant, the induction motor load has reached the limit of the transformer capacity. The power factor of the average commercial induction motor load is in the neighborhood of 70 per cent. so that by installing a synchronous motor, which in addition to delivering mechanical power would also furnish sufficient leading current to raise the power factor of the whole load, the capacity of the plant could be increased by a considerable amount without increasing the transformer or switching equipment. Under these conditions a synchronous motor of 35 per cent. of the total transformer capacity will deliver an energy load of 20 per cent. of the total capacity and at the same time raise the power factor of the system to 90 per cent.

The efficiency of a generator is affected by the power factor, although this variation is greatly modified by the ratio of the constant to the variable losses in the machine. This is determined by the design of the generator. There will be a difference of 2 to 2½ per cent., however, in the efficiency of a generator operating at normal load and unity power factor, and the same generator operating at the same kv-a. and 0.8 power factor. The excitation required by a genera-

can when operating at 0.8 power factor will be in the neighborhood of 50 per cent greater than that required for the same kv-a. at unity power factor. This rate of increase in excitation does not continue for power factors below 80 per cent.

The effects of varying the power factor on transformers, although smaller in magnitude than the effects on the generator, must be considered since they occur twice, at the step-up and step-down transformers. The losses in a transformer with constant kv-a. output are practically the same for any power factor. However, since the losses are usually small in a well designed transformer, the decrease in the efficiency, due to decreased power factor, will be about 0.4 per cent. with a reduction in power factor to 0.8.

Due to the fact that transformers contain a certain amount of inductance it is readily seen that lagging current will cause an increase in the internal voltage drop of the transformer and thus will affect the regulation, particularly in the case of large transformers which usually have a high reactance. The capacity of a transformer decreases with the power factor in the same manner as in the generating equipment.

The decrease in efficiency, between unity and 0.8 power factor for constant kv.a. in a circuit, which includes generator, transformers and the transmission line, assuming average values, will be approximately as follows:

Generator	2.0 per cent.
Transformers...	0.8 per cent.
Transmission Lines	2.2 per cent.

This gives a total of 5.0 per cent. decrease in efficiency. The regulation of the system becomes steadily worse with lower power factors, although the increase varies in different portions of the circuit. This condition results in either greatly increased excitation on the generators, or else widely varying voltages at the receiving end of the circuit for varying loads. The capacity of the system for equal heating will be decreased directly with the power factor. This point is modified, however, in the case of the generator fields, which will suffer an increase in temperature with lagging power factors, due to the increased excitation required.

It will be noted that by an investment of a relatively small amount in the condenser, a much larger amount represented by the prime movers, generators, transmission line and transformers, is made available. In addition, the operating efficiency of the entire system is very greatly increased.

An attempt has been made in the foregoing to point out various conditions which make the installation of the synchronous equipment of commercial value. The discussion has been primarily confined to that covering a synchronous motor carrying both mechanical load and condenser load. This is, of course, the ideal arrangement as highest efficiency is obtained from the synchronous machine under those conditions. There is, however, a special application of synchronous motors coming under the classification of "Synchronous Condensers" and divided into two main classes of service. First—the regulation of power factor, merely, without mechanical load; second, the regulation of voltage by means of varying power factors. In the first class of operation, the condenser would probably be installed as a portion of the customer's equipment and would, therefore, probably be removed from the control of the power company. Where a condenser is used, however, for regulating the voltage of a transmission line, the condenser will probably be the property of the owner of the line and will be operated as a part thereof, and moreover will probably be controlled by an automatic voltage regulator.

In the case of the first class for power factor correction only, the synchronous condenser will only be required to deliver leading current and would cost approximately 15 per cent. less than synchronous motor having the same continuous rated capacity.

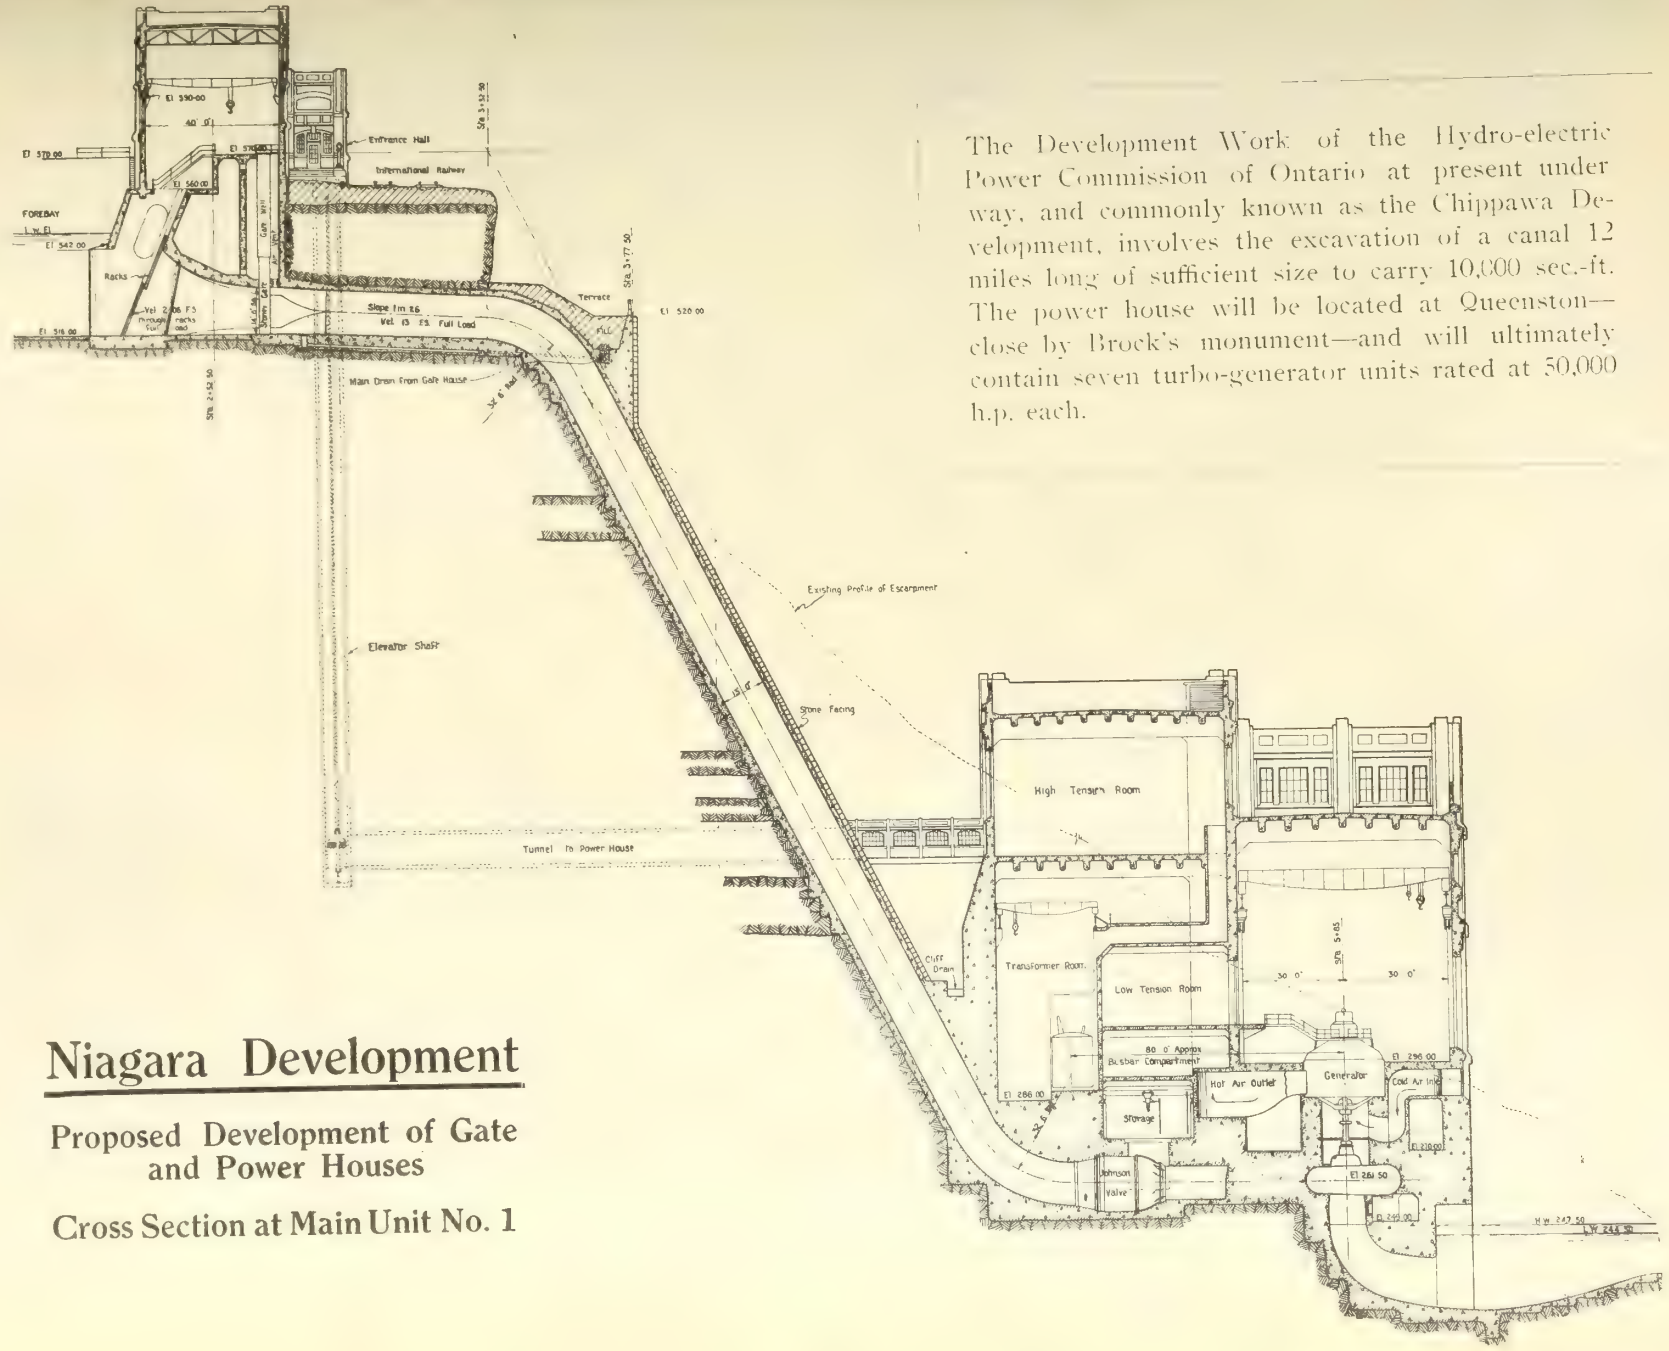
In the case of the second class for voltage regulation where automatic regulator is used in conjunction with the motor to maintain the voltage constant, the condenser must deliver both leading and lagging current and the cost will be practically the same as a synchronous motor of the same capacity.

a The installation of the synchronous equipment is, however, not warranted in every instance and is a matter which should be given every detailed consideration before the installation is proceeded with.

For any such installation which may be under consideration the matter should be brought down to a dollar and cents basis, if possible. The cost of the new apparatus should be balanced against increase in capacity. Increased operating costs should be balanced against increase in efficiency, and a comparison should be made of the service with and without the condenser.

In general a synchronous condenser will have the most effect and therefore, will be of the greatest value when it is installed at the same point as the load since in this case it benefits all apparatus between itself and the generator. A further gain is obtained by driving a mechanical load in addition to the corrective action of the condenser.

For the average industrial use, it may be taken as a general rule that the synchronous motor having equal motor capacity and condenser capacity, is the most efficient and economical. In this case, the motor will carry full rated mechanical load at approximately 71 per cent. power factor.



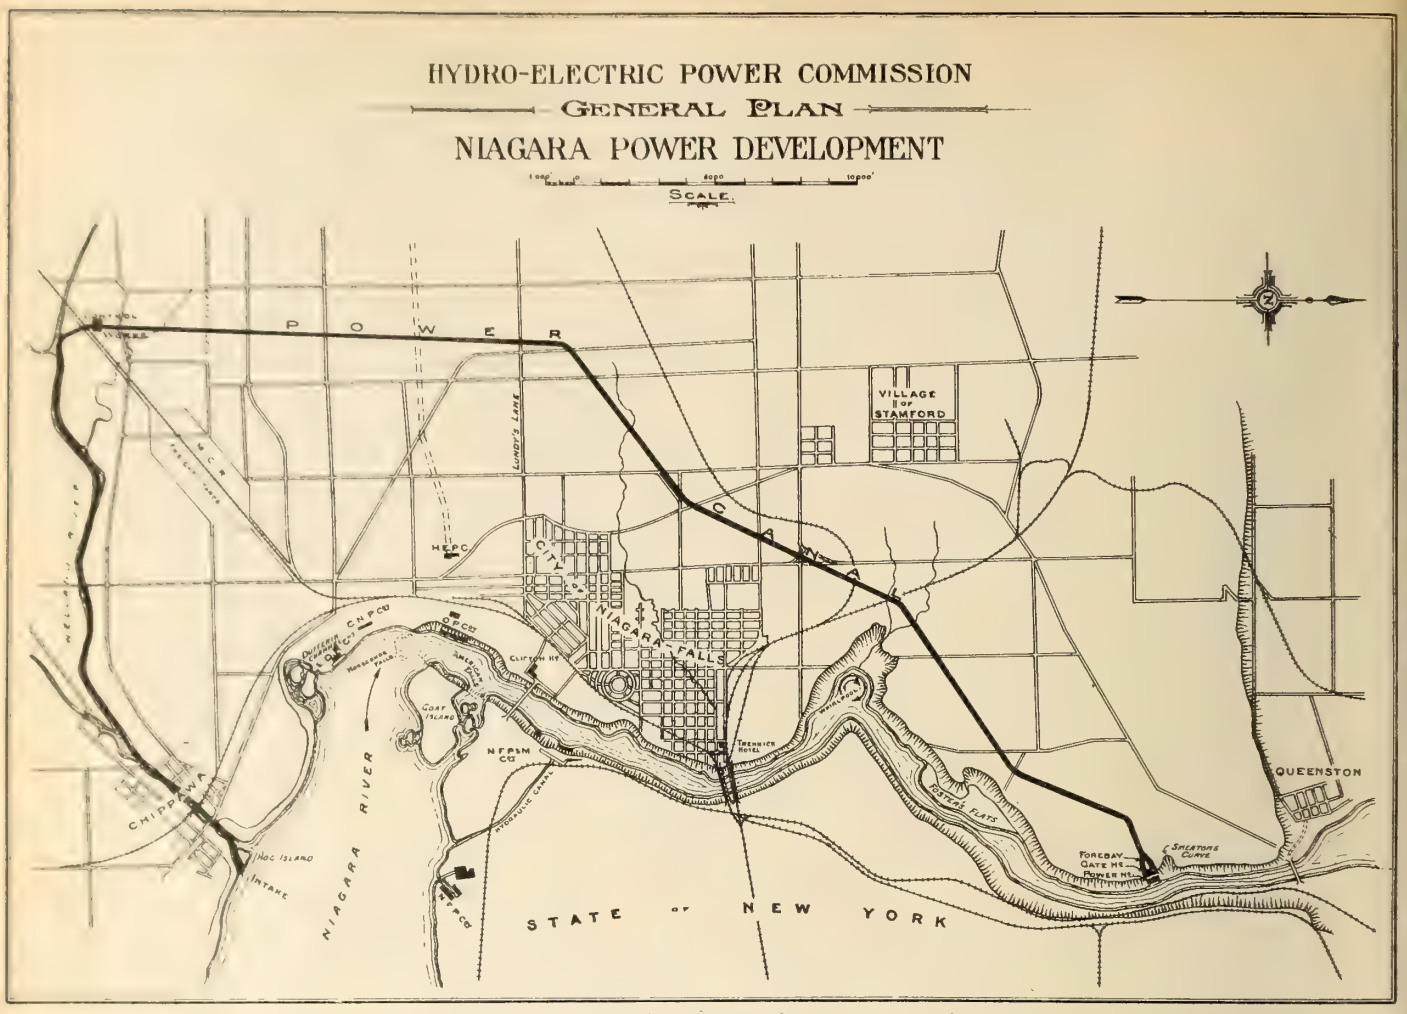
The New 300,000 H. P. Hydro Development

Probably the most interesting item in connection with the convention was the illustrated description of the progress of the work of the Ontario Commission on the 300,000 h.p. Chippawa plant, given by Mr. H. G. Acres, chief hydraulic engineer to the commission. This was followed by an inspection of the work by the delegates who motored over the route.

The plans of the commission have now reached a stage when we are able to reproduce a lay-out of the whole scheme and also a cross-section of the development works at the power-house.

As will be seen from the drawing, the canal encircles the city of Niagara Falls, Ont., having its intake at Hog Island, Chippawa, and its outlet just above Queenston and in close proximity to the famous Brock monument. The total length of the canal is approximately twelve miles. After the most careful study of cost and efficiency figures, it was decided to make an open cut throughout, though for a section of the course where there is a heavy rock cut the advisability of tunnelling was carefully considered. It was shown, however, that the advantages were in favor of the canal even on this section.

The canal follows the course, for about the first four miles of the work, of the old Welland River, in which the direction of the stream has been reversed—that is, the Niagara River is tapped at Hog Island, the water being drawn



The Development Work of the Hydro-electric Power Commission of Ontario at present under way, and commonly known as the Chippawa Development, involves the excavation of a canal 12 miles long of sufficient size to carry 10,000 sec.-ft. The power house will be located at Queenston—close by Brock's monument—and will ultimately contain seven turbo-generator units rated at 50,000 h.p. each.

Niagara Development

Proposed Development of Gate and Power Houses

Cross Section at Main Unit No. 1

Canal intake at Hog Island, outlet just above Queenston—A 12-mile open cut.

west up the Welland River some four miles before it turns north into the canal. The grade of the canal throughout is such that the current will vary from one to four miles per hour, the velocity over the greater portion of the distance being around the latter figure. At this higher speed there is practically no danger of the formation of ice.

The work of excavation is going along as well as could possibly be expected under all the adverse conditions of the present day. A feature of the construction is the use of electric power down to practically the minutest detail. The engineers of the commission studied this question very carefully and were able to show a saving of almost 50 per cent. over other sources of power supply. One of the features of the excavation work is an 8-yard Bucyrus shovel, also electrically operated.

The canal and all the general works are planned for a development of 300,000 h.p., though it is probable that only 100,000 h.p. equipment will actually be required at the start. A cross-section showing the general plan of the fore-bay, gate-house, generating, and transforming house, is also shown herewith. The total head obtainable according to this drawing is that approximately between elevation 554.0 and elevation 246.0, a difference of 308.0 ft.

The standard width of the canal will be 48 ft. and the maximum depth of cut 135 feet. Approximately one-third of this cut is through rock. The earth sections will be concrete lined as will also the rock sections if it can be shown that a sufficient added capacity would result to justify the additional expenditure.. The penstocks connecting the head gates with the turbine room will be approximately 14 ft. in diameter, and 450 feet in length. This latter figure indicates that the penstocks will be almost in a vertical position, this being possible by the advantageous location of the powerhouse, which will stand at the water's edge under a sheer rock precipice. The turbines will be single runner type, 50,000 h.p. capacity, so that the initial installation will call for two units. Generators will be vertical type, suspension bearings, operating at 187½ r.p.m. and generating 12,000 volts. The ultimate installation will probably be seven such units—six for continuous operation and the seventh as spare.

The work of installation also necessarily includes the erection of a large number of bridges, including accommodation for four railways.

A most interesting feature in connection with the design of this plant is an experimental duplicate, in miniature, at present in course of erection. The results of tests with this miniature plant will be utilized to verify the theoretical conclusions of the commission's engineers and will have a direct bearing on the ultimate design of a number of the details. This plant is nearing completion at Dufferin Island, which is located a short distance above the falls.

The work of installation on the 50,000 h.p. addition to the Ontario Power Company's plant is also going forward, and it is expected this amount of power will be in readiness for the next winter's peak. When the larger development is completed, it is the understanding that the new additional installation at the O. P. Company's plant will be dismantled, this being considered an economical proposition on account of the much greater capacity obtainable from the same quantity of water owing to a practical doubling of the head.

The city council of St. Thomas, Ont., have under consideration the purchase of one-man cars to be operated as a means of reducing the annual deficit.

Canadian Electrical Association Convention

One-Day "War" Session at Chateau Laurier, Ottawa—Valuable Reports Presented—A. Monro Grier, K. C., New President

The 28th annual meeting of the Canadian Electrical Association was held in the Chateau Laurier, Ottawa, on June 21, 1918. On account of war conditions it was decided to confine the meeting strictly to business so as to encroach as little as possible on the time of the delegates. As a result, only one day was given over to the convention.

Following the policy of a year ago, no papers were presented for discussion, the programme consisting almost entirely of the reading and discussion of reports of the various committees. The session opened at 10 o'clock on Friday morning with President D. H. McDougall's address, followed by the report of the secretary-treasurer. Mr. T. C. Martin, secretary of the National Electric Light Association, was present, and addresed the delegates. Mr. Wills Maclachlan gave a demonstration of resuscitation from electric shock, and a brief description of the accident prevention work he is carrying on throughout the province.

The following reports were presented in more or less detail:

Prime Movers Committee Report—Mr. R. M. Wilson.
Overhead Lines Committee Report—Mr. A. A. Dion.
Committee on Electrical Apparatus Report—Mr. J. F. Neild.
Meter Committee Report—Mr. William Volkman.
Commercial Light and Power Sales Committee Report—Mr. H. E. Randall.
Representative of N.E.L.A. Light Sales Bureau—Mr. E. N. Hyde.
Rate Research Committee Report—Mr. P. T. Davies.

A number of these reports are printed in the following pages.

Pressure was brought to bear on Mr. McDougall, the retiring president, and who has held the office for three years, to continue for another year. Mr. McDougall was able to advance sufficient reasons, however, for relinquishing the office, and his resignation was regretfully accepted. Mr. A. Monro Grier, K.C., vice-president Canadian Niagara Power Co., was unanimously chosen to succeed him. The complete list of officers and executive follows:

President, A. Monro Grier, K.C.; first vice-president, E. A. Dunlap, M.P.P., Pembroke Electric Light Company, Pembroke, Ont.; second vice-pres., C. S. Bagg, Montreal Light, Heat & Power Company, Montreal; third vice-pres., A. P. Doddridge, Quebec Railway, Light, Heat & Power Company, Quebec; hon. sec., T. S. Young, Toronto; sec.-treas., W. Volkman, Toronto.

Management Committee—D. H. McDougall, Toronto Electric Light Company, Toronto; J. S. Norris, Montreal Light, Heat & Power Company, Montreal; P. T. Davies, Southern Canada Power Company, Montreal; P. M. McDonough, Quebec; J. S. Gould, Citizens' Electric Light Company, Limited, Smith's Falls, Ont.; H. M. Hopper, St. John Railway Company, St. John, N.B.; Louis Pratt, Dominion Power & Transmission Company, Hamilton, Ont.; J. B. Woodyatt, Southern Canada Power Company, Montreal; W. H. McIntyre, Ottawa Electric Company, Ottawa; E. J. Beaumont, Shawinigan Water & Power Company, Montreal; H. E. Randall, Shawinigan Water & Power Company, Montreal; A. V. Gale, Hull Electric Company, Hull; J. F. Neild, Toronto.

A number of interesting reports were submitted at the afternoon session, and a unique demonstration was given with the assistance of two linemen from the Ottawa Electric Company, who feigned electrocution in order that the delegates might be given an opportunity of seeing the prone-pressure method of resuscitation. The proceedings wound up with a banquet in the Chateau Laurier.

President-Elect. A. Monro Grier, K. C.

Past-President D. H. McDougall, who has just been elected third vice-president of the N. E. L. A.

Report of Committee on Light and Power Sales

In presenting our report herewith, your Committee has followed, with a few modifications, the subdivisions set forth in the report of last year, and has tried to carry out in a consecutive manner the extension of ideas there presented, up to the present time.

LIGHTING SALES

Residence Lighting

The use of semi-indirect, indirect and dense ornamental lighting units has been increasing throughout the past year, due to the softness and uniformity and pleasing appearance of the light obtainable from them, together with the not-too-exorbitant cost of operating such lighting units, brought about by the use of high efficiency lamps, the general tendency today is to make the lighting of the house more in accord with the ornamentation, and to eliminate the use of bare, ugly lighting units in an otherwise artistic room.

This increased use means, in spite of high efficiency lamps, a very materially increased use of electricity, and one which warrants the increasing attention of the central station, and can probably best be handled by the use of specialists who will indicate to the consumer the advantage and disadvantage of various lighting units, and will in this way assist in bettering the class of lighting in residences along the lines of pleasing appearance, softness and uniformity, all tending toward the more secure position of electricity as the ultimate source of artificial illumination, equalling—if not surpassing—daylight. This tendency will undoubtedly react very much to the advantage of the central station.

Store Lighting

The same general conditions which have brought about the softening of the source of light in residences have been even more plainly manifested in the lighting of stores. The present-day merchant is daily becoming more convinced of the usefulness of high grade lighting in bringing customers to his store, and pleasing them when they are there. Window lighting, due to the more aggressive spirit of the stores and the results obtained in store lighting, has made remarkable strides. The use of very high lighting intensities in store windows, properly produced by suitable fixtures concealed from view and distributing the light uniformly over the display, is coming into more general use. This recognition of the value of good lighting of the storekeeper is a fertile field for the central station, due to long burning hours and the large units taken, and should be cultivated intensely.

It is interesting to note that in those sections of the country where window lighting has been reduced on account of power shortage, the storekeepers report that they never realized the great value of proper window lighting until deprived of it.

Industrial Lighting

The central stations of Canada have played an important part in the production of munitions in a way not usually thought of, that is, by assisting manufacturers to increase their night production, and their day production in dark parts of their factories, by adequate, properly designed factory lighting. The effect of such lighting is incontestably to materially increase the production possible with old-time factory lighting, and to make possible a night production equal to the day production. At this time of shortage of man power also, there is the other aspect of a very material reduction in industrial accidents brought about by adequate factory illumination.

The necessity and the usefulness of this type of lighting is so apparent today that every central station should immediately look over its field to determine if it cannot aid in munitions production, or in general industrial activity, by assisting the manufacturers in properly lighting their factories, to the mutual benefit of both the manufacturers and the central station for whom the high load factor of this lighting service should be a material benefit.

Outdoor Illumination

The use of flood lighting for the lighting of large spaces has gone forward rapidly during the past year, for night work on construction jobs, for working in large industrial store yards, and for police protection around plants of every description. The use of flood lighting at night has demonstrated its usefulness in making every passer-by a policeman, thus allowing more efficient protection to our factories, waterworks, and shipyards, etc., without materially increasing police protection with a diminished police force.

A new use which is coming to the front for this type of lighting is the lighting of the area around a burning building to assist the firemen at night and to prevent theft.

Many American cities are now using flood lights, erected on the corners of the high buildings in the busy sections of the city, for intensely illuminating the corners where traffic congestion exists—this supplementing the ornamental and ordinary illuminations existing at these points.

Wherever tried, the reduction of accidents and the ease with which traffic can be handled at night without a policeman has been amply demonstrated, and is leading to the use of this type of lighting for corners in the less congested districts.

Street Lighting

Extensions to street lighting services, due to general war conditions, have not been numerous during the past year, it being the general tendency in those sections where street lighting contracts are expiring, or where new types of street lighting are being considered, to continue with the present type of lighting until a more favorable cost for lighting units exists, as otherwise street lighting services, which are very largely a capital cost proposition, will be materially increased, perhaps to the detriment of proper street illumination. There is a tendency, however, to change from arc lighting systems to high efficiency incandescent lamp systems and to make extensions wherever possible on the incandescent lamp system, due in considerable measure to-day to the lower first cost of the incandescent system, and its lower maintenance cost, thus freeing men for other services. The use of bare incandescent lamps is practically discontinued in sizes over 100 c.p. An extensive use of glassware which properly distributes the light for street lighting purposes is becoming evident.

Daylight saving, which came into effect in this country in the early spring, has not been in effect long enough to accurately determine its effect on lighting income, but it would presently appear that lighting income during the summer months will be decreased some 10 per cent., which, however, will probably be made up by the increased use of light which generally follows upon a reduction of lighting bills, which should be of considerable assistance in increasing lighting income during the winter months; so that although this feature should be carefully reported on next year, it is probable that the gross income over a year's period from lighting service will be actually increased after a few years' operation of the daylight saving law.

Moreover, the increased demand for domestic service as set forth later in this report, will, during the summer months, if properly cultivated, more than offset the slight

decrease in lighting income which will exist during this year and for a few years to come.

General

It seems evident that the tendency to-day is for the consideration of electric lighting, not merely as a plain, ugly source of light, but as a means of producing a soft, pleasing, properly distributed, artistic illumination, which can be obtained at low cost, and which is beyond competition. The uses of light in an industrial way are playing an important part in business and in the production of munitions, and this role is becoming much more generally recognized. The central station may, therefore, with some degree of satisfaction review its activities in the lighting field over the past year, and should endeavor to play a still more important part in the lighting field in the years to come.

POWER SALES

The demand of the central stations for the supply of power in large quantities on short notice to munition plants has continued and increased throughout the past year. The supplying of this power has in some sections of the country produced an acute power shortage, which has occasioned more careful study of power delivery conditions to munitions plants.

Such studies have in many cases indicated that the supply of power to these plants, which was assumed originally to have been of a very temporary nature, was carried out over lines which were of small capacity and which occasioned very heavy losses in power as the manufacturers increased their loads. In many instances the handling of these loads, or increases thereto, has been more satisfactorily carried out, both from a service standpoint and a saving in power standpoint, by the delivery of power to the larger munitions plants over high tension circuits with transformer equipment at the manufacturing plant.

Power demands have also increased materially, due to coal shortage, which has again brought to the front the more economical production of power by central station means, as demonstrated by the Fuel Controller's coal saving through the use of central station plants for power supply rather than the isolated plants in the various factories.

Those central station companies generating by hydraulic power are in this way very materially assisting in the elimination of the coal shortage, and thus helping in the solution of the transportation problem.

The power shortage has called to the attention of the companies suffering from it the necessity of being much more careful in their sale of power, and the conditions of sale, among which perhaps the most important is the regulation of power-factor. In the past, due to loose power-factor conditions and non-enforcement thereof, power lines have become encumbered with motors of excess capacity or of improper voltage, or improperly repaired, with the result that many companies were supplying motor loads at a very low power factor, materially decreasing their line capacity, their generating station capacity and transformer capacity, all of which is so urgently needed at the present time for munitions and general purposes.

Most companies throughout the country are now strictly enforcing their power-factor regulation clauses, or writing in new power-factor clauses in their new contracts, with the result that the users of power, due to penalties involved for poor power-factor, are readjusting their equipment to operate at a proper and reasonable power-factor, which has worked very much to the benefit both of the central station and of the consumer.

The power shortage in some sections of the country has made necessary the curtailment of the supply of power to non-essential industries, and if relief is not afforded will tend to the complete elimination of power supply to such industries. It would seem to your Committee that provision should be made, by government assistance or otherwise, just as much to the power company as to the munitions manufacturer, inasmuch as the power company is supplying one of the most important raw materials—that is, power—to so enable the power company to maintain its business so that the normal manufacturing activities of the country may go on, thus tending to stabilize the industrial conditions in the country after the war, and in many instances allow the establishment or expansion of industries to supply export demands which were previously supplied from Germany. If this country is to maintain its industrial place and to make this place a more important one, the activities of legitimate, normal industries of the country, even although not strictly employed on munitions work, should be encouraged and assisted in every proper manner, and should by no means be allowed to be stamped out, due to a shortage of power.

We also feel that new applications for power supply for motor power uses should be met insofar as is physically possible, inasmuch as it would build up the industrial activity of the country and make for a more stable condition after the war.

Domestic Service

Nowadays the use of electricity in the home is far from limited to the simple electric light, but it is becoming more and more important for other domestic uses, such as toasters, grills, percolators, flat-irons, vacuum cleaners, washing machines, dish washing machines, sewing machines and other small motors, and to a larger degree the electric range and electric water heaters. Your Committee, therefore, believes that this report should comprise a section devoted to these domestic uses of electricity outside of electric light, as these bid fair to far surpass the income from domestic electric light, and under present-day conditions serve also as important conservers of fuel, thus aiding the national cause.

The use of the smaller of the household appliances noted above has increased greatly during the past year, due to the difficulty experienced by householders in obtaining domestic help, and they have, therefore, turned to this "universal servant" for assistance and have been in this way made familiar with the great assistance that electricity can offer through the above appliances.

The familiarity with domestic electric appliances which the householder has thus gained, and the absolute success of these appliances, make it easy for the central station to get a very much increased amount of this business during the present year, and campaigns with this in view should be carried out.

The most important source of domestic service revenue is the electric range, from which an income of between $35 and $75 a year can in general be secured, which is many times the income from the same householder for lighting service only.

At this time the use of electric range becomes more and more important as it is a conserver of fuel, even though the electricity is generated in a steam generating station. The average range will consume something between 10 and 175 kw.h. per month, which generated in a modern steam generating plant would not require more than 200 to 350 lbs. of coal, whereas the ordinary coal range consumes some 600 to 1,000 lbs. a month, thus making a net gain of approximately 60 per cent., which if applied to all the householders of Canada would mean a tremendous difference in the congestion of our railroads and the amount of money sent out of the country for coal. Of course, where water power is the source of electricity, the net saving of coal is 100 per cent.

All companies having available power and who have been supplying electric ranges previously report tremendous increases in the use of electric ranges, which amply demonstrate their success.

We therefore recommend that every central station im-

immediately investigate carefully the electric range possibilities and make suitable rates therefor, as we feel the income to be thus obtained will be a most important factor in the central station industry in the very near future.

We further recommend that the sale of all electric ranges be carried out on an installed price basis, so that only one sale has to be made covering complete range, as it is found that where a range is sold by itself it is sometimes difficult to make the sale of the installation on account of its excessive cost in certain sections of the country.

In those cases where the central station does not do the installation work, this basis can still be used by co-operation with the contractors' association or the contractors in the various cities.

As electric cooking represents a new and advanced type of cooking, it is very necessary that central stations going after the electric range business should be prepared to furnish adequate service, preferably by means of a competent demonstrator, so that all purchasers of ranges will be properly instructed in their operation, and during the first few months of operation periodical inspections should be made to ensure that everything is operating satisfactorily, and that the purchaser is obtaining all the information which will lead to the fullest success of the range. The purchaser should be made to feel that attention to details or repairs or any defect with the stove will be immediately and satisfactorily taken care of, and that when a purchaser takes an electric stove he is going to be absolutely satisfied therewith.

While this service is very necessary at the present time, later, when the use of electric cooking becomes universal, and as standard stoves are developed, the necessity for this service will probably disappear, as it has in the gas business.

It is already noticeable that manufacturers are following up the suggestions made by the central stations and are in this way obtaining what will soon become a standard range, which will be practically free from minor defects, and which will require practically no attention. The central stations should continue this policy of suggestions, because they are in the best position to determine the slight defects which exist and the slight changes which may be necessary to perfect the electric range, and we feel certain that all range manufacturers will be very glad to get the suggestions from central stations.

Electric water heating is becoming more and more common on all services supplied from hydraulic plants, and, as stated in last year's report, it seems certain that the electric water heater should always be installed whenever an electric range is installed on systems with such a source of power supply. Marked improvements and betterments in electric water heaters have been brought about during the past year, and heaters now available are giving excellent service. On those installations on electric water heaters in which furnaces are used for water heating in the winter time and the electric water heater only used in the summer time, water heating load gives a more uniform yearly load curve for the installation, as it is thus prevented from overlapping the lighting peak in the winter and fills up the valleys of the load curve which normally exist in the summer.

Most central stations are supplying water heater services on a flat rate basis, either directly or on a double throw switch, so that electric stove and electric water heater cannot be used simultaneously.

Other Uses

Arc Heating Processes during the past year have expanded in use by the industries reported last year. Calcium carbide, ferro-silicon and steel have very largely increased, probably in the total by 50,000 h.p., whereas the production of zinc by arc process has been discontinued. The use of the electric steel furnace for average steel foundry practice seems to have become assured, as for the average small foundry it offers a means of making a superior steel at low cost and with a freedom from uncertainty which is quite impossible with the methods hitherto used. It is probable also that electric furnaces of this type will also be used for grey iron casting, and it might be that in small foundries, casting both iron and steel, the same furnace be used for both. Central stations should look over their field of operation and call the attention of steel foundries to the use of the electric furnace.

Resistance Heating Processes have increased materially, notably for calcining coal and the manufacture of carbon electrodes, and very largely for abrasives. During the past year the use of electrically-heated japanning ovens has grown to a large extent, both for light sheet metal products and for heavier products. This type of load being a very high load factor is very desirable for the central station.

Electric Welding has advanced materially during the past year and seems to be now expanding in usefulness for the heavier welding processes. Spot welders are becoming almost universal in replacing light riveting processes.

Electric Bake Ovens have been installed in many places in Canada and are giving universal satisfaction, turning out a superior quality of bread at very low baking cost. This use of electricity is destined to largely expand in the near future and offers an attractive use for off-peak power, although the business readily stands the firm power rates. The use of electrically-heated muffle furnaces for heat treatment and other purposes is expanding considerably, and the use of small electrically-heated melting pots for base metals is commencing.

Electrolytic Processes

No material advances to electrolytic processes have taken place during the past year except for the production of hydrogen, oxygen and chlorine. Electrolytic generators for hydrogen, oxygen and chlorine furnish a cheap and easy means for the production of these gases in relatively small quantities for industrial uses. Industries requiring these gases are becoming more and more numerous, and, due to the difficulty of obtaining these in the open market, many companies are installing their own gas generators.

Industrial Trucks

During the past year the use of small storage battery trucks and tractors has increased considerably. These trucks are used in industrial establishments for moving materials through the plants, in railway stations for handling baggage, mail and express to and from trains, for freight terminals, steamship docks and a great many other purposes. These trucks replace a great number of men used as truckers, and not only free them for the national service, but materially decrease the cost of service. This load, being in general an off-peak battery charging proposition, is a very attractive one for the central station. This report of your Committee is intended to concisely state the advances in electric lighting and power sales which have taken place during the past year, and advances in the use of electricity. A review of this report must indicate the tremendous value of the central station industry to the country and the most important part that it is accomplishing in the production of munitions, in the advancement of industry in the solving of the servant problem in the home, in the conservation of fuel and thus in transportation, the conservation of man power, and in many other ways—all materially assisting in the attainment of the success of our national efforts and in the building up of the industrial condition of this country, not only to be of service in winning the war, but to be of service in the general upbuilding of the country after the war.

Respectfully submitted,

W. H. McIntyre, F. M. Dusenberry,

Rate Research Committee Report

To the President and Members of the Canadian Elec. Assn.:

Gentlemen:—

Your Committee reports that they have carefully watched the trend of current events with a view to incorporating in their report any changes in rates or any tendencies in public opinion and have noted the following matters as being, in their opinion, worthy of notice. Using the chart which was designed last year as a basis for their investigations, they have looked into the following matters:

Contracts

Legal Arbitrations—An outstanding matter for Canada has been the settlement of the Tramways Franchise in the city of Montreal by a Board appointed by the Provincial Government. The matter of a new franchise for the city of Montreal and its surroundings has been the centre of political agitation for a matter of some six years, but in the fall of 1917 the matter was taken out of the hands of the civic authorities and placed in the hands of a commission, who had authority to study the details and had to report back to the provincial government their ratifications.

The contract, or franchise, as finally approved is a three-sided agreement whereby the company is protected in its investment, the public protected on the rate of fare, and the city is protected on the point of view of taxation, and general conditions involving routes of cars and maintenance of service, etc. The agreement is a very long one, but the special point worthy of notice is the fact that the company is permitted to charge fares which will cover their bond indebtedness and up to a reasonable percentage on the common stock. After providing for renewals and the city's portion a fund is created into which all surplus earnings are placed. When this fund exceeds a certain amount, the fares are automatically reduced, and if the reduction does not effect this fund then further reductions may be ordered. If, however, the fund is eaten into then rates are automatically raised again.

The interesting point about this agreement is that the province of Quebec has followed the lines of the United States Government in protecting privately owned public utilities, and, at the same time, protecting the public. While this policy has been in force throughout the United States for the past eight or ten years, and is continuously becoming more widespread, in Canada on the contrary, privately owned public utilities have regularly been singled out for political activity with a resulting insecurity of investment, which has tended, especially in Ontario and the West, to curtail their development.

Obligations

The obligations of customers in Canada in view of the shortage of power and high cost of machinery have been increased in the matter of providing proper apparatus, especially with a view to the employment of power factor, whereas in the past power factor clauses have not been vigorously applied. Nowadays nearly all companies are requiring the customer to keep their power factor within reasonable limits at all times and to pay for any deficiencies. The question of the measurement of power factor as to whether same should be computed to the time of maximum load on the consumer's installation or to the time of maximum load of the company's system, or whether the average power factor taken by the customer of the whole period of his operation should be taken as the determining factor is not yet standardized.

Special.— In the matter of rates for summer business, it is a known fact that no meter rate can properly produce enough revenue on the average summer customer to pay the interest on the investment, and it should be noted that in the United States rates as high as 18c per kilowatt hour have been tried.

One of the member companies has instituted a new type of rate this year with a view to getting, at least, fixed charges out of these customers, the rate being $1.00 per outlet for the first 10 outlets plus 50c per outlet for the excess over 10, payable in advance, plus 4½c per kilowatt hour. It is found, generally speaking, that summer customers get away without paying their last bill and are very difficult to trace. In the case of the above rate a good deal of the charges are being collected in advance, and the company does not stand to lose so much revenue from "skips."

Cooking Rates.—A study of the rates charged for electric cooking in the United States shows that the prevailing rate is 3c per kilowatt hour for straight cooking. While this may seem high to those who are accustomed to the low rates prevailing in Winnipeg and Ontario, nevertheless, electric cooking is within the economical reach of anyone who has ever used gas or oil stoves. An average taken over a number of cases shows that for cooking in the average family that 25 kilowatt hours are required per person per month, and at the above rate of 3c this represents 75c per head. After five or six persons are catered for the usage per head drops off very fast and the usage of over 200 kilowatt hours per month is quite exceptional. Various rate forms are being tried out by member companies for electric cooking, but the committee has no hesitation in advising member companies that a 3c net rate is an acceptable and profitable rate.

Revenue

Measurements.—No new instruments have been devised for the cheaper measurements of maximum demand, and the lack of such instruments is still felt. The same thing applies to measurement of power factor.

Psychology

Expediency—Political.—The Rate Research Committee feel that they can hardly present their report without referring to the political significance of the shortage of power in the Niagara district, as this is a case where political action has resulted in a curtailment of necessary supplies which may have a very important bearing upon the positions of the allies in the great war. In the Niagara district, on both sides of the river, are many plants whose output is essential to the successful prosecution of the war, this output being absolutely dependent on the supply of power. Political action placed these plants, at any rate on the Canadian side—where they are, although in other parts of Canada ample power was available, and is still available for their requirements.

The output of these plants has been regularly and seriously curtailed owing to the fact that the political machine in Ontario over-sold their output in a blind manner, and gambled upon Providence helping them out. Even today it is reported that the output of the plants, instead of being supplied to the necessary and essentiail war industries, is being diverted to light up the small towns and villages far distant from the plants. The political significance of this action is only equalled by its immorality.

Bibliography

The weekly issue of the rate research bulletin of the N.E.L.A. will keep the member companies supplied with the

most recent information, and those of our member companies who are not subscribing to it are strongly advised to do so.

Cost of Service

The cost of service has naturally raised in all parts of the country, but it is with pride that the electrical industries in Canada can point to the fact that the cost of service to the ordinary consumer has not yet been advanced. In the case of short term contracts on munition business higher prices are now obtainable than originally, but in most cases the rates charged are in no way comparable with the cost of any other kind of service.

Taxes.—The Committee find that the original chart did not include the sub-heading "Taxes," and are, therefore, including one. In the point of view of taxation, a new impost has been developed in one of the towns. This consists of a tax of 25c per month on all users of electricity. This tax was successfully passed over to the consumer, although the company supplying the current has tried to do the collecting. While any tax of this kind is liable to become general, member companies are warned to take steps to see that the tax is placed on the consumer and not on the company, and, secondly, that such tax is kept as low as possible, as even 25c per head has had the effect of causing some users of electricity to discontinue same.

The whole respectfully submitted:

A. A. Dion,
M. C. Gilman,
J. B. Woodyatt,
P. T. Davies (Chairman).

Report of Committee on Electrical Apparatus

Your committee herewith submit the following notes on the progress in the development of electrical apparatus.

The past year has been one of high pressure in business, the insistant demand for electrical machinery, particularly motors of all kinds, has forced the intensive production of standard types, and this has no doubt in many ways re-acted in delaying the normal advancement of the development of electrical apparatus.

There has been a wide expansion of the application of electrical processes in the metallurgic and chemical industries, causing many problems to arise in heat control, speed control, protection, etc., and these should prove a very fruitful field for an interesting report in the future.

The development of remote control, self control and automatic synchronizing and paralleling devices and the ruggedness of machines, has made possible the automatic substation. The fact that motor generators and rotaries are now left to run virtually unattended, speaks eloquently for the progress in machine design, and in these days of labor shortage and the necessity for economy, the automatic sub-station should receive the widest possible attention.

In alternating current generators, no radical changes appear, but the mechanical improvements permit of higher speeds in larger units. A horizontal waterwheel generator rated at 20,000 kv.a., 660 volts, 60 cycle, and operated at 360 r.p.m., represents the limit of this class as attained at present, while in the slow speed machine, a 10,000 kv.a., 6600 volt vertical waterwheel generator, 60 cycle, has been built at 55.6 r.p.m.

In alternating current motors, the speed control question is developing, and now, motors of 220 h.p. are made with a speed range of 430/300. With auxiliary speed control apparatus, the synchronous speed disappears, and control can be maintained in most cases without sacrificing torque.

In heavy duty motors for mill work, progress is being made especially in the reversing drive type, and installation has been made of a 22,000 h.p. unit. This is a double unit consisting of two motors electrically in series on a common base. The current is supplied by a flywheel type motor generator consisting of three units electrically in series.

In the question of transformers, the principal improvement lies along the lines of better insulation distribution, and greater ability to resist the mechanical forces imposed by short circuits. These results are obtained by using circular coil construction.

The development of single phase self cooled transformers up to 8,000 kv.a. has resulted in a type of cooling apparatus using external radiators, combined with the standard corrugated case. Oil conservator tanks are also used. In this arrangement the transformer cases are air tight, and are completely filled with oil, the expansion being taken care of in the external conservation tank usually placed on top of the case.

In direct current motors, the principal advance has been in speed control, being obtained by an auxiliary winding embedded in the main pole pieces, additional to the commutating poles. This compensating winding practically prevents flux distortion losses, permitting rapid acceleration from low to high speed.

The question of service, particularly on high tension power lines, is demanding effectual relay application, and today important feeders are no longer affected by troubles being allowed to spread.

These results are largely brought about by the application of balanced currents with instantaneous overload relays of the single plunger type or with relays of the induction type.

The single plunger relay is now a more rugged piece of apparatus, and is proving capable of the heavy duty at times imposed on it.

The great advantage of the induction type relay is the accuracy and permanence of the calibration.

Your committee wish to express their appreciation to those who have assisted them.

Respectfully submitted,

J. F. Neild, Chairman,
Committee on Electrical Apparatus.

New Use for Vacuum Cleaner.

During the recent Red Cross campaign in New York City one of the features was the use of a vacuum cleaner to extract coins and bills from the crowds that assembled around the speakers' stand. The long tube was thrust out into the crowd and the money placed at the opening was quickly whisked out of the donor's hand into a bag at the rear. The novelty of the scheme added not a little to the sum total of the campaign.

Canadian Westinghouse Secretary is Dead

Mr. John H. Kerr, Secretary of the Canadian Westinghouse Company, died at his home in Hamilton on June 24, after a brief illness. Mr. Kerr was born in Pittsburg and was associated with the Westinghouse Electric and Manufacturing Co. as early as 1892. When the Canadian company was organized in 1903 he then was appointed secretary and has since resided in Hamilton.

Report of the Meter Committee

Owing to the great and pressing needs brought about by the war there has been little time available for manufactures of meters to devote to new developments, so that in going over the field we find very little change during the past year.

Watthour Meters.

The General Electric Company standardized their 1-14 watthour meter for general use about three years ago. This meter is still standard with them and no changes have been made in the design.

The Canadian Westinghouse Company have developed a new single phase watthour meter known as the Type CC, which now supercedes the Type C in sizes from 5 to 20 amperes, two wire. In designing this meter, simplicity of construction, calibration and manufacture have been given great attention, all parts are made on an interchangeable basis, and the assembly of parts is checked by gauges so that very little variation is found in the product. All wearing and calibrating parts are readily accessible so that the costs of repairing and checking are reduced to a minimum. The tests on this meter show a performance considerably better than the Type C. The 60 cycle meter load curves show a variation of .2 percent from no load to 75 per cent. overload, and a drop of .8 per cent from 75 per cent to 100 per cent overload; the performance of the 25 cycle meter while not as good as the 60 cycle is much better than the Type C. The load curves vary about .3 per cent from no-load to full-load with a drop of 1 per cent at 50 per cent. over-load and 2.2 per cent at 100 per cent over-load. There is little change in the accuracy for voltage variations 10 per cent above and below normal.

The Sangamo Company have made no changes in their type H. meter which has been their standard for the last two years. It might be of special interest, however, to note that the Sangamo Company are now assembling all of their meters and manufacturing 90 per cent. of the parts in Canada.

The Packard Company have made changes in the design of their Type K. induction meter which overcomes the previous difficulties encountered in their product.

There have been no changes in the line of d.c. watthour meters during the past year which have come to the attention of your committee.

Graphic Wattmeters.

The Westinghouse and General Electric Companies have made no changes in their line of graphic meters during the past year.

The Esterline Company have made some changes in design on their type E.B. meter which will considerably increase the usefulness of this meter. We understand, however, that these improved meters are not as yet in production, so that it will probably be three or four months before they become available to the trade.

The Bristol Company have developed a line of graphic strip recording meters for a.c. and d.c. of the dynamometer type. The electrical design has been given very close attention so that these meters should prove very acceptable to the trade. The clock mechanism is very substantial and is arranged for a normal speed per hour and a special speed by moving a lever of the same speed per minute.

Indicating Meters.

Switch-board type—There has been very little change in the general lines of switch-board meters during the past year, the principal changes being entirely along the lines of smaller meters, so as to decrease the amount of switch-board space required. All companies manufacturing these lines now have a line of small meters.

The General Electric Company have placed on the market a miniature round pattern a.c. ammeter approximately 3 in. diameter, similar in appearance to their direct current instrument Type D.M. This instrument has a rolled bakelite cover and drawn brass cover with full glass dial.

A new line of "fan-shaped" instruments has been placed on the market by the Weston Electrical Instrument Company. These instruments are of the permanent magnet type and are d.c. voltmeters and ammeters for switchboard mounting. There are four sizes known as models 267, 269, 271, and 273. The principal dimensions of model 267—4-5/64 in. wide x 3⅜ in. high x 1 3-32 in. deep, scale length 2.5 in. and the large instrument, model 273, dimensions are 9-5/16 in. x 7-31/32 in. x 2-1/16 in., scale length 7.6 in. These instruments have remarkably long, open and legible scales, the longest scale ever attained in instruments of their size. The scale arc is 120 degs. as against about 86 deg. for the round pattern Weston meters of similar principle. The shunt drop of the ammeters is 50 m.v. and the voltmeters have a sensitivity of about 100 ohms per volt. Each model has a wide list of standard ranges, for instance, model 267 voltmeter being listed in 38 ranges from 50 m.v. to 150 volts, and the ammeter ranges run from 1 amp. to 150 amps. in 21 capacities all self-contained to 30 amps.

Laboratory Instruments.

A laboratory standard line of voltmeter, ammeter and single phase wattmeter known as the Model 326, has been developed by the Weston Electrical Instrument Company. These instruments are of the dynamometer type and are for a.c. and d.c. service. These instruments are conservatively guaranteed to be within 1/10 of one per cent on direct current or an alternating current up to 133 cycles, or if specially ordered up to 600 cycles. They are compensated for temperature, are air damped and shielded from external magnetic and electrostatic influences. The scales are provided with mirrors and are sub-divided into fifths by means of diagonal lines intersecting with six concentric arcs. The length of the scale is approximately twelve inches. The instruments are provided with zero correctors, spirit levels and adjustable leveling screws. The wattmeter is entirely compensated for phase angle errors and the current circuit is designed for 100 per cent. continuous overload.

Demand Meters.

The determining of customers maximum demands is probably one of the greatest problems of the meter engineers at the present time. For large customers this is not as great a problem as for the small customers, for in the former case the power company is justified on account of the greater revenue in installing the more expensive meters now necessary to determine the maximum demand, but for small loads this method cannot be considered.

There are on the market at the present time quite a number of definite time maximum demand meters manufactured by the different companies, but practically all of these meters are open to the objection that if a customer's maximum demand does not occur in synchronism with one of the definite time periods, the actual maximum demand would not be recorded. The problem of obtaining a customer's

maximum demand by the definite time demand meters depends, of course upon the type of load being supplied. In other words, the nearer a customer operates to 100 per cent. load factor, the more accurate this method becomes. Similarly, if a customer's maximum demand occurs only once or twice during a month, and this maximum demand is considerably above his average load, the operating company is liable to lose as high as 50 per cent. of its revenue.

From a meter or engineering standpoint the ideal is to be able to obtain the absolutely correct maximum demand at whatever time it occurs. However, since the present range of meters are not always practicable for this purpose, compromises are necessary between the rate charged for power and the method of determining the amount of power used, so as to insure the requisite return to the power company for services supplied.

Probably the latest development in the line of maximum demand meters is the Westinghouse Type R. H. meter, wheih is built on an entirely new principle. This meter is operated on a thermal and heat storage basis. A coiled thermostat, the temperature of which is directly controlled by the amount of kv.a. in the circuit, is enclosed in a metallic case. This case is made light or heavy, depending upon the length of demand period desired. Upon any change in load the temperature of the element begins to change and continues to do so until the rate of heat loss is balanced by the rate at which energy is being supplied. The change in temperature takes place according to a logarithmic law, and it is in this respect that the meter gives an entirely different type of maximum demand from that given by the straight line electro-magnetic meters. The meter is designed on a 15 and 30 minute basis.

The principal feature claimed on this meter is the fact that it takes into account the heating of generating equipment as it follows the same general laws. However, while this is true the adoption of the meter would mean an entire re-arrangement of rates and contracts in order to insure the operating company the necessary income.

Power Factor Determination.

One of the greatest problems which the operating companies have to face at the present time, owing to high costs of material and long deliveries, is the question of getting out of their available equipment 100 per cent. value. Wherever a.c. power is used for power purposes the capacity of lines and apparatus must be greater than would actually be necessary if we did not have to provide for the wattless energy of customers apparatus.

The meter to be desired for this purpose is one which will record volt amperes directly. Considerable time and money have been spent in an attempt to design a meter of this type, but as yet none have been produced. The Westinghouse Type R. H., however, comes closer than any other since it is operated entirely on the thermal principle which, of course, takes the wattless component as well as the watts.

Discussion.

At this time, when central stations are confronted with the problem of handling an ever increasing load over existing lines, and are confronted with extremely high cost for additions to line capacity, the relief which can be obtained by the bettering of power factor of consumers' loads is of prime importance.

Those companies which in the past have not paid particular attention to the power factor of their customers' loads, and have made no provision for a reasonable power-factor, or have made such provision and have not enforced it, have found, upon investigation, that in general the power-factor of these consumers' loads is extremely low, and instances of 60 per cent. and less are by no means rare. If the power factor of the consumers' loads was increased to some reasonable figure, say 85 per cent. to 90 per cent., the carrying capacity of secondary lines for the same voltage drop would be more than double, and a corresponding saving in power lost would result.

In the past, there seems to have been no standard clause covering the regulation of power factor in power contracts, but one of the larger power companies has the following clause, which would seem to adequately cover the entire correction of power factor, either for power sold on a maximum demand basis, on a kilowatt hour basis, or on a mixed rate, as follows:

> "If at any time, when the power is being delivered to the purchaser at normal voltage and frequency, the total volt-amperes so delivered exceeds that which would result if the power which the purchaser is then taking hereunder were delivered at a power factor of 85 per cent., the volt-amperes delivered shall be calculated as power upon the basis of 85 per cent. power factor."

and in this regard, it should be noted that the determination of power factor, which is to be used as a basis for penalty, requires a materially different method of determination when applied to maximum demand power or when applied to kilowatt hour energy consumption.

Some companies have adopted the practice of writing into their contracts the statement that kv.a. for billing purposes is to be taken as the kw.; this is applicable to both the maximum demand method and kilowatt-hour method. This method, of course, is only applicable to special contracts, where the rate can be readily changed, i.e., it would not be entirely fair where definite power rates are established for an entire community unless all contracts are written to contain the clause.

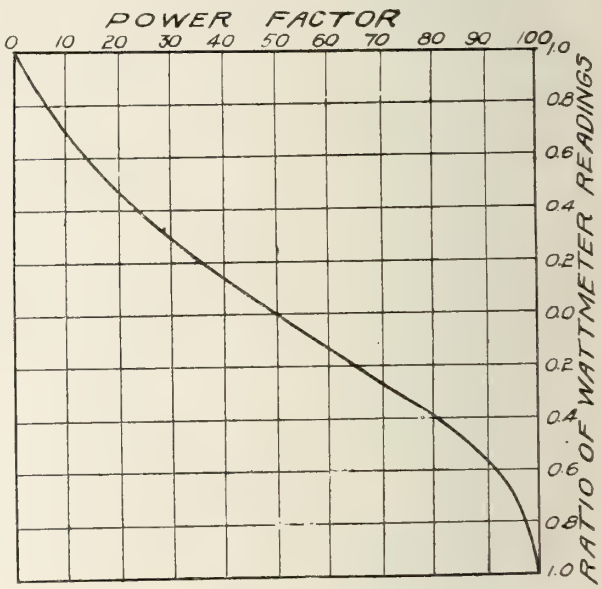

Plate I.

It would, therefore, seem of importance to outline the means and methods available for the determination of the power-factor of the consumers' loads; in order to properly apply the penalty in case of low power-factor, which will sooner or later result in the bettering of the consumers' low power-factor, and in the meantime will allow the power company a reasonable return on the line capacity used for the supply of power to low power-factor loads, which could otherwise be employed for the supply of new consumers.

Methods.

1. The instrument first brought to mind to obtain some

record of power-factor, is some sort of power-factor recorder or indicator. These instruments have, however, not been found satisfactory by several of the member companies, in that they require at least 60 per cent. of full load to be of sufficient accuracy to warrant their use, and also in that they are least accurate at low points of the scale, where most penalty power-factors lie. One of the member companies has gone so far as to abolish their use entirely, replacing them by a graphic watt meter, connected to read the wattless component on consumers' loads, and even in power stations. For these reasons, these instruments can be assumed as unsatisfactory for our purposes.

II. The simplest and most obvious method of determining average power-factor is by the use of either two

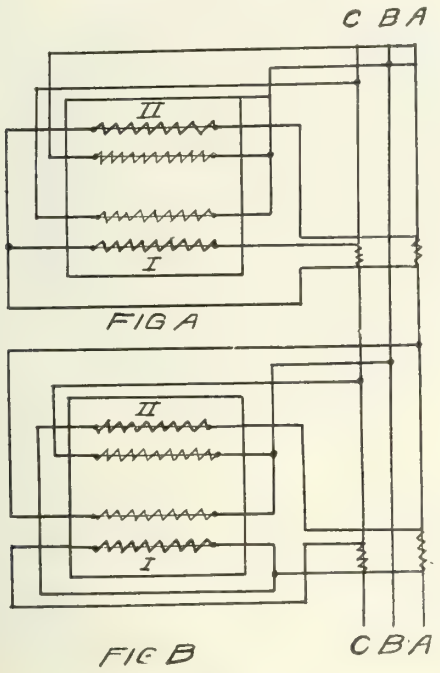

Plate II.

single phase meters, or one single-phase meter in connection with a polyphase instrument, which gives the total energy consumption. This method is of course applicable in cases only where the consumer is charged on a straight kilowatthour rate, or on a mixed rate basis. This method assumes exact balance of load, and is not applicable to loads which are badly unbalanced. On large loads of induction motors, however, there is no objection to using it, as very closely balanced loads are the rule.

Assuming balanced load, then, in any three-phase circuit, the reading of one single-phase watthour meter will be

$$W_1 = VI \cos(\theta + 30^\circ)$$

while

$$W_2 = VI \cos(\theta - 30^\circ)$$

will be the reading of the second single phase meter.

The sum of these two quantities may be shown to be the total power in the circuit, while the ratio of their sum and difference may be reduced to the following quantities:

$$\text{Tan } \theta = (W_1 - W_2) \div (W_1 + W_2)$$

therefore, the angle of lag may be found from which the cosine or power-factor may be taken from any table of natural functions.

An easier method, perhaps, of determining power-factor is to read off the value of power-factor from a curve plotted between power-factor and ratio of watthour meter readings. One familiar form of this curve is shown in Plate I attached, the ratio being expressed as less than one, that is the ratio of the smaller to the larger reading.

In cases where single-phase meters are employed, in connection with polyphase meters, the reading of the former is to be subtracted from the latter, the ratio being taken between the difference and the reading of the single-phase meter, or vice versa, as the case may be. The average power factor is then determined from the curve, and the total consumption increased in the ratio of contract power factor to the actual value.

Metering Badly Unbalanced Loads.

III. In cases of badly unbalanced loads, or in cases where power is sold on a maximum demand basis, the above method is not applicable, and it becomes necessary to use equipment which will give the average power-factor of an unbalanced load, or power-factor at the time of peak.

One method available to determine average power-factor under these conditions is by connecting a standard watthour meter or graphic wattmeter to read proportional to the wattless component of the load. This method was partly described by H. S. Baker before the 1911 convention of the Canadian Electrical Association. This equipment used in connection with ordinary apparatus giving true power or energy offers a means of obtaining power factor at peak.

In plate II., Fig. A, is shown the standard connection of a meter to read true power, or the energy component of the load. Fig. B. shows the connection in which the indication is proportional to the wattless component, in which it is noted that the current in element I of the meter is reversed, while the potential of element I is taken from phase B.C. instead of B.A.; the current of element II is unchanged but its potential is taken from phase B.A. instead of B.C. It may be shown that with the meter connected in this manner, the indication is equal to $2\ VI \sin \theta$ for balanced loads, and for unbalanced loads, it is still proportional to the wattless component. By multiplying this indication by 86.6 per cent., the true wattless component is obtained. Therefore, from the corrected reading of this meter in connection with reading of true power, the angle of lag, and

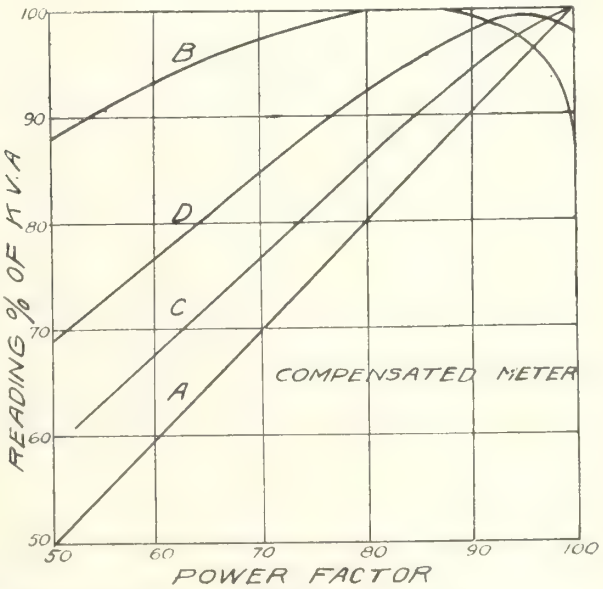

Fig. III. A—Curve for Accurate Meter.
B—Compensated to read 100% K.V.A. at 85% P.F.
C—Compensated to read 90% K.V.A. at 85% P.F.
D—Compensated to read 85% K.V.A. at 85% P.F.

and hence the power factor, may be determined by taking the ratio of 86.6 per cent. of the former to the latter reading, or again a curve may be constructed between ratio and power factor.

Instead of using the above factor of 86.6 per cent., there is no reason why the manufacturers of the various types of meters could not turn them out to read the wattless component directly. Indeed one of the larger manufacturers has already done this for one of the member companies.

Considerable care should be exercised in connecting up

[illegible] to obtain the correct indication. One method [illegible] to be successful is as follows:

Referring to Plate II, Fig. A. If the potential lead of element I is connected to phase C instead of A, the potential lead of element II is connected to phase A, instead of C, the middle wire being unchanged, while no changes are made to the current coils; if the meter was connected correctly at first, the indication under the revised connection will be zero. If it is not the current coils should be changed until a zero indication is obtained.

IV. A third method which is applicable to watthour meters and indicating watt meters, and which has been applied to an indicating watt meter by a German instrument company, consists essentially of overlagging the potential element of the meter, so that the angle between unity power-factor current, flux and the potential flux will be 90 plus an angle, say alpha instead of 90. This overlagging may be accomplished by inserting an external reactor in the potential circuit of the meter, or by using the compensating coils of the commercial type of meter, should a sufficient amount be obtainable for cases met in practice.

Assuming a contract power-factor of 85 per cent. as a basis to work upon, the ideal meter would be one which would indicate 85 per cent. of kv.a. for all values of power-factor. To approach this ideal condition, this method consists of artificially shifting the voltage coil current so that the indication will be a certain percentage of kv.a. at 85 per cent. power-factor, and so that the registration will be as near 85 per cent. of kv.a. as possible, at the actual operating power-factor.

With the meter compensated to read a certain percentage of kv.a. at 85 per cent. power-factor, the voltage vector will be turned through some angle, say ϕ, to effect the desired compensation; then the readings of the two elements of the polyphase meter will be as follows:

$$W_1 = VI \cos (30° + (\theta - \phi))$$
$$W_2 = VI \cos (30° - (\theta - \phi))$$

To illustrate the equations four curves have been plotted as per Plate III, in which different degrees of compensation have been chosen, which are shown in the table below:

Curve.	θ at 85% P. F.	Reading at 85% P. F.	Angle of Compensation
A	31° 48′	85% KVA	0°
B	31° 48′	100% "	31° 48′
C	31° 48′	90% "	6°
D	31° 48′	95% "	13° 36′

From a consideration of these curves it will be seen that with a 70 per cent. power-factor load, and with a meter compensated to read 95 per cent. kv.a. at 85 per cent power-factor, shown by Curve C., Plate III, the consumer would be charged actually 85 per cent of kv.a. and for variations in power-factor of 5 per cent. either way, the meter would register sufficiently accurate for all material purposes.

Upon examination of curve B, which is for a meter compensated to read 100 per cent. kv.a. at 85 per cent. power-factor, it is seen that the power-factor may vary from 70 per cent. to 95 per cent. without a result in error greater than 3 per cent. in volt-ampere measurement. Therefore, on consumers whose power-factor falls between these limits, it would be possible to install a meter with this compensation taking 85 per cent. of the readings as amount to be charged for, assuming, of course, contract power-factor to be of this value.

Plate IV. shows curves similar to those of Plate III., but drawn to show the rate of overcharge and undercharge at various power-factors for the different compensations. It should be noted in connection with this type of meter that for leading power-factor, there will be a deduction in registration, so that it should not be used unless a reduction in price per kw.h. for energy taken at leading power factors is justifiable. Also an inherent drawback of the compensated meter, as well as of the ordinary meter, is that, as the power-factor decreases the rate of under-charge decreases, a much less desirable arrangement than if the rate of undercharge decreased only when power-factors of more than contract amount were obtained.

Example.

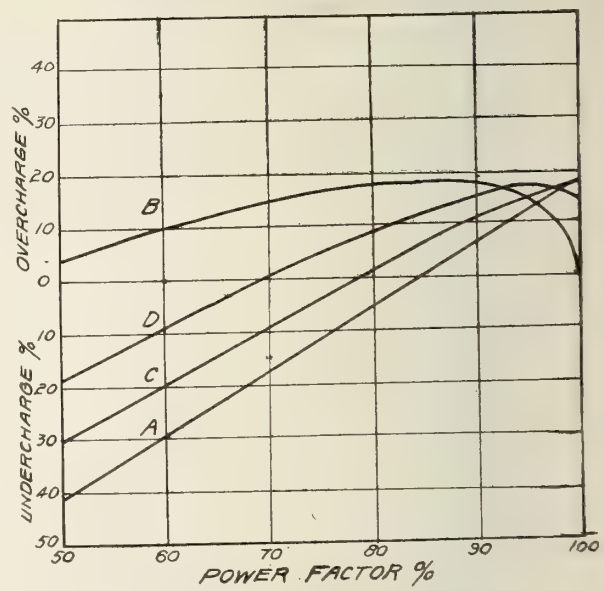
One example of additional revenue to the central station from the application of penalty due to low power-factor may be cited. Power is sold to this consumer on a kilowatt-hour basis, and the load is a very closely balanced one, power-factor being determined from ratio of readings of two single-phase watthour meters.

Month	Average P.F.	Return due to low P.F.
Jan.	82.6%	$109.68
Feb.	79.5%	260.16
Mar.	78.5%	282.03
Apr.	83.1%	91.54
May	78.5%	338.64

Conclusion.

Summarizing, it may again be emphasized that the question of consumers' power factor is of vital importance to central stations in these days of increasing loads and costs, and all available means of bettering conditions should be rigorously investigated.

We have seen that, among others, four methods are available, the graphic power factor meter probably being of little use, and may be rejected. The single-phase meter method is cheap and simple, but assume balanced load, and also is of no use where power is sold on a maximum demand basis.



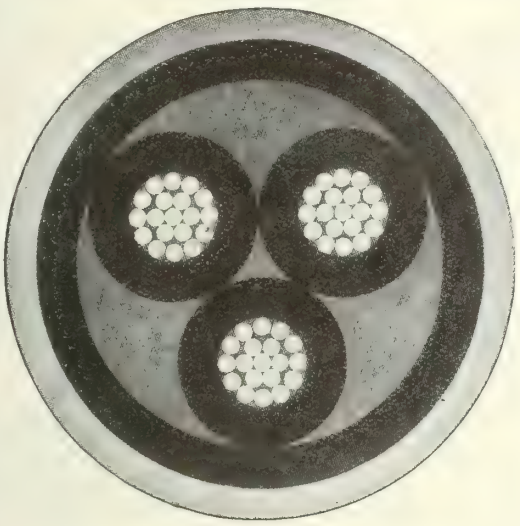


Plate IV. A—Curve for Accurate Meter.
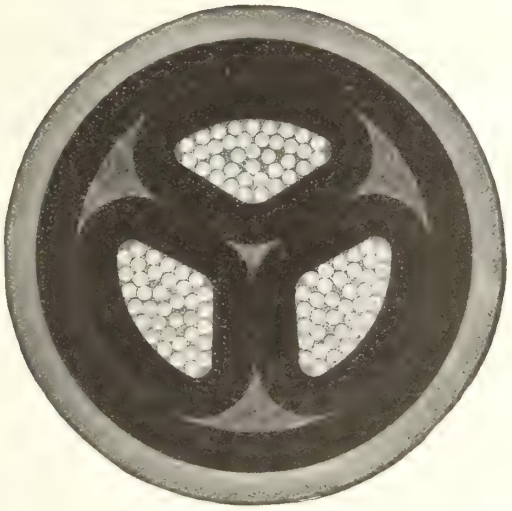
B—Compensated to read 100% K.V.A. at 85% P.F.
C—Compensated to read 90% K.V.A. at 85% P.F.
D—Compensated to read 95% K.V.A. at 85% P.F.



The third method of connecting standard wattmeters or watthour meters to register proportional to the wattless component would seem to be most preferable in cases of unbalanced load of widely varying factors, both for power sold on a maximum demand basis, or kilowatt hour basis.

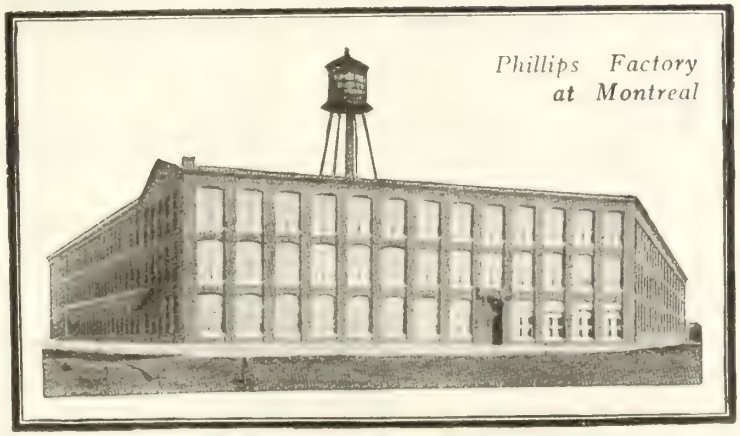
The fourth method, the compensated meter, is applicable for load, the power-factor of which is fairly constant, and has the advantage of reading kilowatt-hours at contract power-factor directly, provided the meter with correct compensation can be taken.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Hand-Book on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Ins. 332 pages, illustrated. Price $2.50.

Direct Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

Electrical Motors, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price $6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.60.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated. Price 50c.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

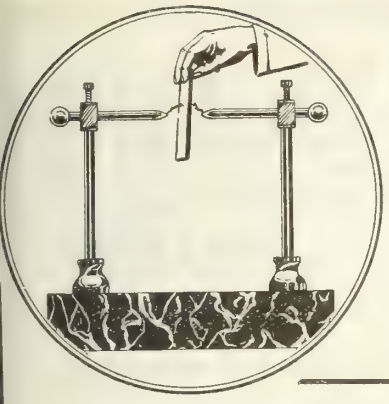
Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.



The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

Electric Rupture 200-400 Volts per 1/1000″ Thickness

Spaulding HARD FIBRE

HIGH Electrical resistance, plus its tough horn-like non-breakable composition, practically indestructible, that will withstand jar, jolt, vibration—rough usage of every kind, makes Spaulding Hard Fibre the ideal insulator that is fast replacing porcelain and hard rubber.

Made in sheets, tubes, rods, washers and special shapes; red, black and grey colors. Send for samples

1—450 KW., 250 volt, Type M, 320 R.P.M. Westinghouse Generator.

Engine Generator Sets

ALTERNATING CURRENT

1—450 KW., G.E., 2300 volt, 3 phase, 60 cycle, 100 R.P.M., direct connected to Allis cross compound Engine, complete with Wheeler condenser and feed water heaters.
1—600 KW., West. Alternator, 2300 volt, 3 phase, 60 cycle, direct connected to West. cross compound Engine.
1—700 KW. Ditto, direct connected to gas Engine.
1—Alternator, C.G.E., 60 cycle, type T.T.B., class 48-600-1501, Form E., volt 2,200, amp. 158, speed 150, direct connected to a Rice & Sargent Providence Engineering Works 18 in. x 36 in. x 32 in., horizontal cross compound condensing engine, complete with condensers; Wainwright horizontal open tube water heater; switchboard, piping and valves. Ask for further information.

DIRECT CURRENT

1—550 KW., 600 volt, A.C.B. Generator, direct connected to a Goldie & McCulloch cross compound Corliss Engine, complete.

MOTOR GENERATOR SETS

1—300 KW., G.E., 125/250 volt, 720 R.P.M., D.C. Generator, direct connected to one 450 H.P., 3 phase, 4000/2300 volt, 60 cycle, Ind. motor, complete with switchboard equipment.
1—150 G.E., 125/250 volt, 900 R.P.M., D.C. Generator, direct connected to suitable syn. motor, 2300 volt, 3 phase, 60 cycle, complete with switchboard equipment.
2—30 KW., 125 volt, West., 1140 R.P.M., D.C. Generator, direct connected to one 3 phase, 60 cycle, 220/440 Ind. motor.

ROTARY CONVERTERS

2—200 KW., 3 phase, 25 cycle, 600 volt, D.C., primary, 13200/1180 volt.
1—500 KW., 550 volt, D.C., West., 3 phase, 25 cycle, with 3 suitable S.P. Transformers, 13200 volt P. and 390 volt S.
1—500 KW., 600 volt, D.C., Rotary Converters, 3 phase, 25 cycle, with suitable transformers; 6600/5940 volt P., 430-286-143 volt S.
1—300 KW., 575 volt, D.C., 370 volt, A.C., 600 R.P.M., complete with three 185 K.V.A., 60 cycle transformers, 2200 volt P., 370 volt S.

STEAM TURBINES

2—400 KW., West., 3600 R.P.M., 160 lb. Steam, 2300 volt, 3 phase, 60 cycle, complete.
1—1500 KW., G.E., Curtis, 3 phase, 60 cycle, 2300 volt, 3600 R.P.M. Complete.
1—500 KW., Allis-Chalmers, 2200 volt, 3 phase, 60 cycle, 3600 R.P.M, complete.
1—1000 KW., Allis-Chalmers, 600 volt, 3 phase, 60 cycle, complete with condensers.

HYDRO ELECTRIC UNITS

2—Hydro Electric units, each consisting of one 1200 H.P. double bronze runner, horizontal cylindrical Leffell Turbines, complete with Governors and Draft Tubes. Direct connected to each of these units are two 437 K.V.A., 3 phase, 60 cycle, 4400 volt, 300 R.P.M., G.E. Generators. Equipment is complete with Switchboard, Oil Switches, Instrument Transformers, etc. Equipment practically new.
1—Hydro Electric unit, 1200 H.P., as above, with one 875 K.V.A., G.E. direct connected unit.

PUMPS AND COMPRESSORS

1—1,000 gal. Underwriter Fire Pump.
1—800 ft., 30 lbs., Vertical Air Compressor.
1—600 ft., 30 lbs. Horizontal Air Compressor.
1—200 H.P., Worthington, 2 stage, 12-inch Turbine Pump, rated capacity 4000 G.P.M., at 60 lbs. pressure, direct connected to one 100 H.P., 3 phase, 60 cycle, 440 volt, 575 R.P.M., Westinghouse Induction Motor, complete with auto starter and no-voltage release.
1—1160 ft. Sullivan two stage belt driven air compressor complete.
1—1586 ft. Sullivan two stage belt driven air compressor, complete.

MISCELLANEOUS

2—Light Freight Car Trucks, splendid condition.
1—10-ton, 4 wheel double block steam locomotive, construction crane.
1—50 H.P. Foss Gas Engine, speed 200 R.P.M., one cylinder; flywheel 4 ft. x 12 in. Used only three weeks.

We also handle a full line of Electric Railway Equipment and Supplies

Our stock changes daily and above list is only a small proportion of what we have. For further particulars wire, telephone, or write. Let us solve your problems. All engineering service without obligation. We advertise and sell your released equipment without cost to you.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY

If a Brush Absolutely Refuses To Spark!

is that not a very good reason for fitting it on your motor generators and commutators?

No-Spark Carbon Brushes

wear longer because they are frictionless and self-lubricating. The remarkable economy of these brushes will appeal to you. They have often outlasted the ordinary brushes 8 to 12 times over.

Write for our latest bulletin.

CALEBAUGH
Self-Lubricating Carbon Co.
1503 Columbia Ave., PHILADELPHIA, Pa.

How long will it stand up?

That is the most important question in Transformer selection. You owe it to your customers and yourself to investigate.

Wagner Distributing Transformers

It is QUALITY that makes them externally dependable.

Send for Bulletin 96113

Where the load is jerky—

such as on the circuit that provides power for this big battery of drills—the cost of fusing is an item that is carefully checked up on.

ECONOMY renewable FUSES

Cut Annual Fuse Maintenance Costs 80%

Economy Fuses lead in accuracy. That is the chief reason why they are used by prominent munitions plants, by the U. S. Navy and others who must consider absolute electrical safety above everything else when buying fuses. Any inexperienced hand can replace the link and renew the fuse in a jiffy. And that 80 per cent. saving is not to be ignored.

An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original effeciency.

OXY-ACETYLENE WELDING & CUTTING

Large Gear broken in centre and successfully welded

A National Necessity

The urgent necessity for the highest efficiency and a maximum production have forcibly demonstrated the value of the Oxy-Acetylene Process for all Industrial purposes involving the joining of metals and cutting wrought iron and steel.

As a means of conserving valuable material and the saving of Time, Labor and Money, its utilization is not only a question of efficiency and economy, but under existing circumstances is the performance of a National Duty.

L'AIR LIQUIDE SOCIETY

Manufacturers of all requisites for the Oxy-Acetylene Process

Toronto, Montreal, Winnipeg, Halifax

LINCOLN MOTORS

Weld and Win

Electric Arc Welding is proving a vital factor in winning the war. Startling evidence of this is accumulating every day.

Lincoln Arc Welders

are now giving the Rock Island Lines 1400 days more engine service per year by hastening their engine repairs. They say that a full equipment of these welders will be equal to the purchase of 23 new engines. And this is only one of many roads using Lincoln equipment.

These welders are saving days of time on vital ship repairs in large eastern dry docks.

They are increasing and speeding up the output of steel castings by filling with molten steel, blowholes, shrinkage cracks and other defects that would scrap 5 to 10 per cent. of the product. Steel castings are absolutely essential in locomotives, steamships, motor trucks and most of all in the actual fighting equipment, cannon, machine guns, rifles, etc.

Get our 48 page illustrated book on welding and see what this wonderful equipment can do in the industry you are interested in. Write on your business letterhead.

Ask for Catalog 104-D.

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

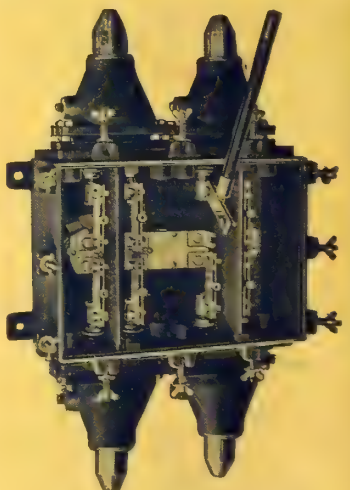
G&W ELECTRIC SPECIALTIES

The Essential Details of G & W DISTRIBUTION BOXES

are very carefully perfected

In the primary box illustrated, switch blade action is combined with bolted contact efficiency



Unit cable potheads with ample compound space make an easy installation without sacrifice of safe, permanent cable end insulation.

The entire box is lined with insulating material—all bolt heads, etc., are coveréd and different polarities are thoroughly barriered.

In the secondary box double U clips give better contact alignment than would a single U clip.

The unit cable potheads attach at an angle, gaining roominess without using excessive wall space.

The line of this material is complete, offering constructions suitable for all conditions.

Primary Box for 2300 Volt Use

Guarding the Grade Crossings with National Trolley Guard

The picture shows a grade crossing with particularly hazardous possibilities—but it is protected by National Trolley Guard.

National Guard is a conductor in the form of an inverted trough of open wire mesh. If the trolley wheel leaves the wire the Guard catches it and furnishes current to carry car and passengers safely out of the danger zone.

National Guard is on duty at hundreds of crossings. After a company has once watched the first installation it usually protects the rest of its crossings with National Guard.

"Guarding the Grade Crossings" is a new booklet which describes National Guard and illustrates various installations. If you have not already received a copy, write to-day.

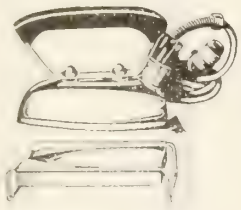
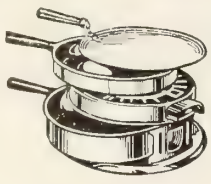
Write Now for Warm Weather Sales

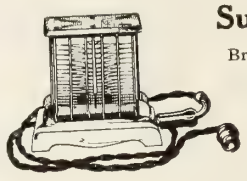
PROFIT and PREMIER Electrical Appliances are linked together. Especially during warm weather days. For now is the time that the comfort and convenience of electricity appeal most strongly. And now is the time to cash in on the PREMIER advertising campaign.



You'll find PREMIER appliances "all that the name implies," all that we claim for them, all that you would expect from this organization.



They are built by men who have grown up with the industry, men who are known throughout the trade for producing appliances of merit, for fair dealing, for progressive ideals.



Few trades are harder to break into with a new line than the electrical appliance field. Yet, PREMIER distribution is coming faster even than we had hoped. That's because PREMIER appliances are sturdier, more handsome in design and finish, better value.

They carry a guarantee that has no strings or qualifications.

Test the PREMIER line now—while warm weather is stirring sales. Write for facts and figures, illustrated folders.

Nerlich & Company, Toronto

Absorbs the Shock

Our special C. & H. Poly-Phase Meter is safe because it is fitted with new double terminal blocks that absorb the shock and reduce the danger of accident resulting from overloaded wires and from surge conditions during lightning storms.

This meter also has more inside room for the connections, and the three or four lines are carried straight through the meter from the left to right. In every respect this C. & H. Poly-Phase is a Safety Meter, and is undoubtedly the one to select for Installation on Long Distance Transmission.

C&H Poly-Phase The Safety Meter

The Company's guarantee goes with every instrument. The new Poly-Phase is as near perfect as it is possible for a meter to be.

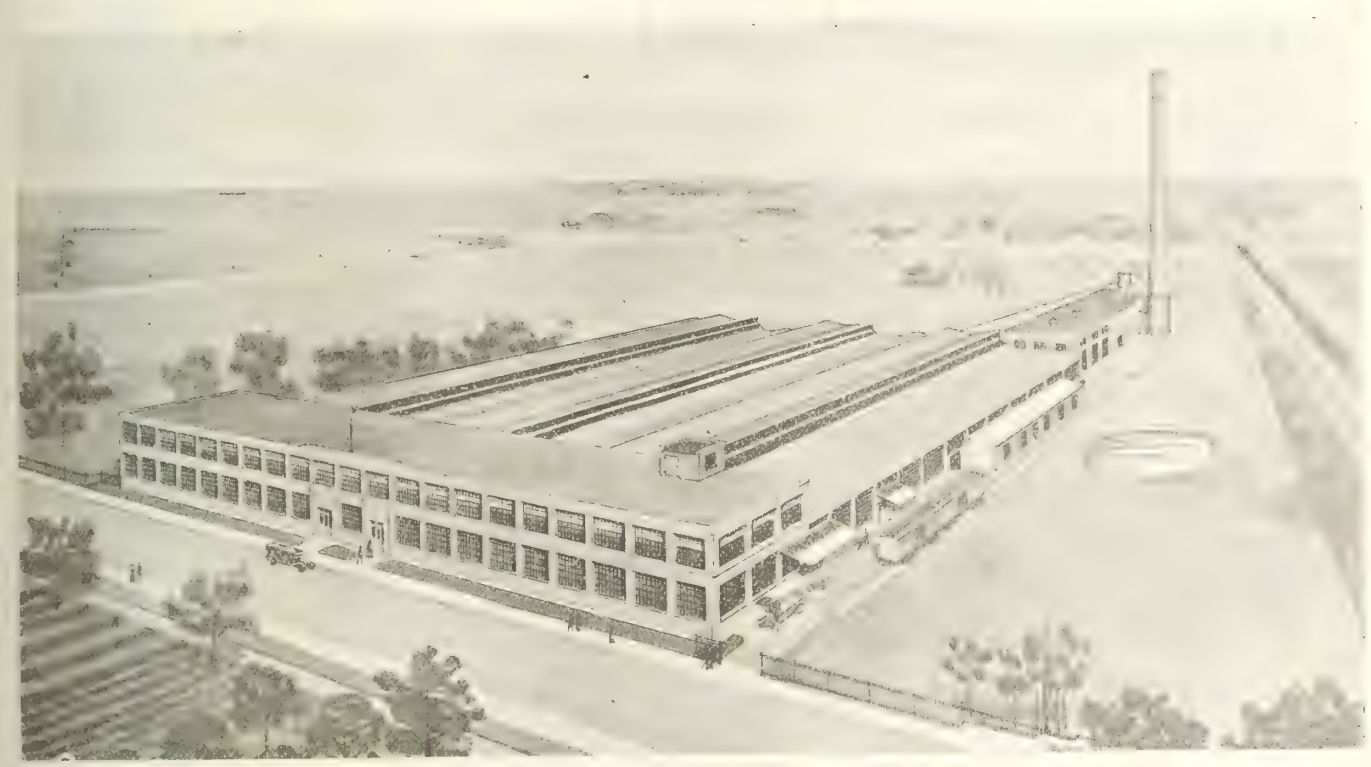
THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.



Bulletin No. 530 describes this instrument.

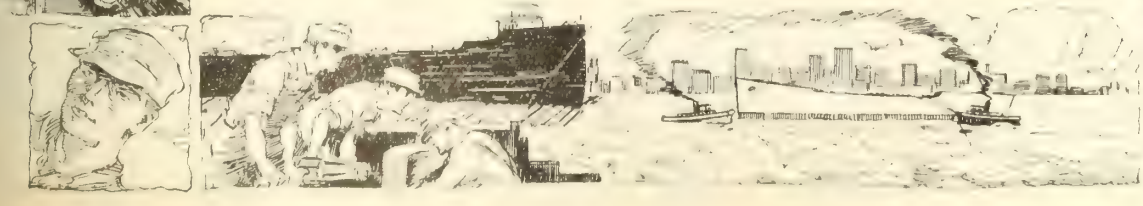
The Needs of the Empire

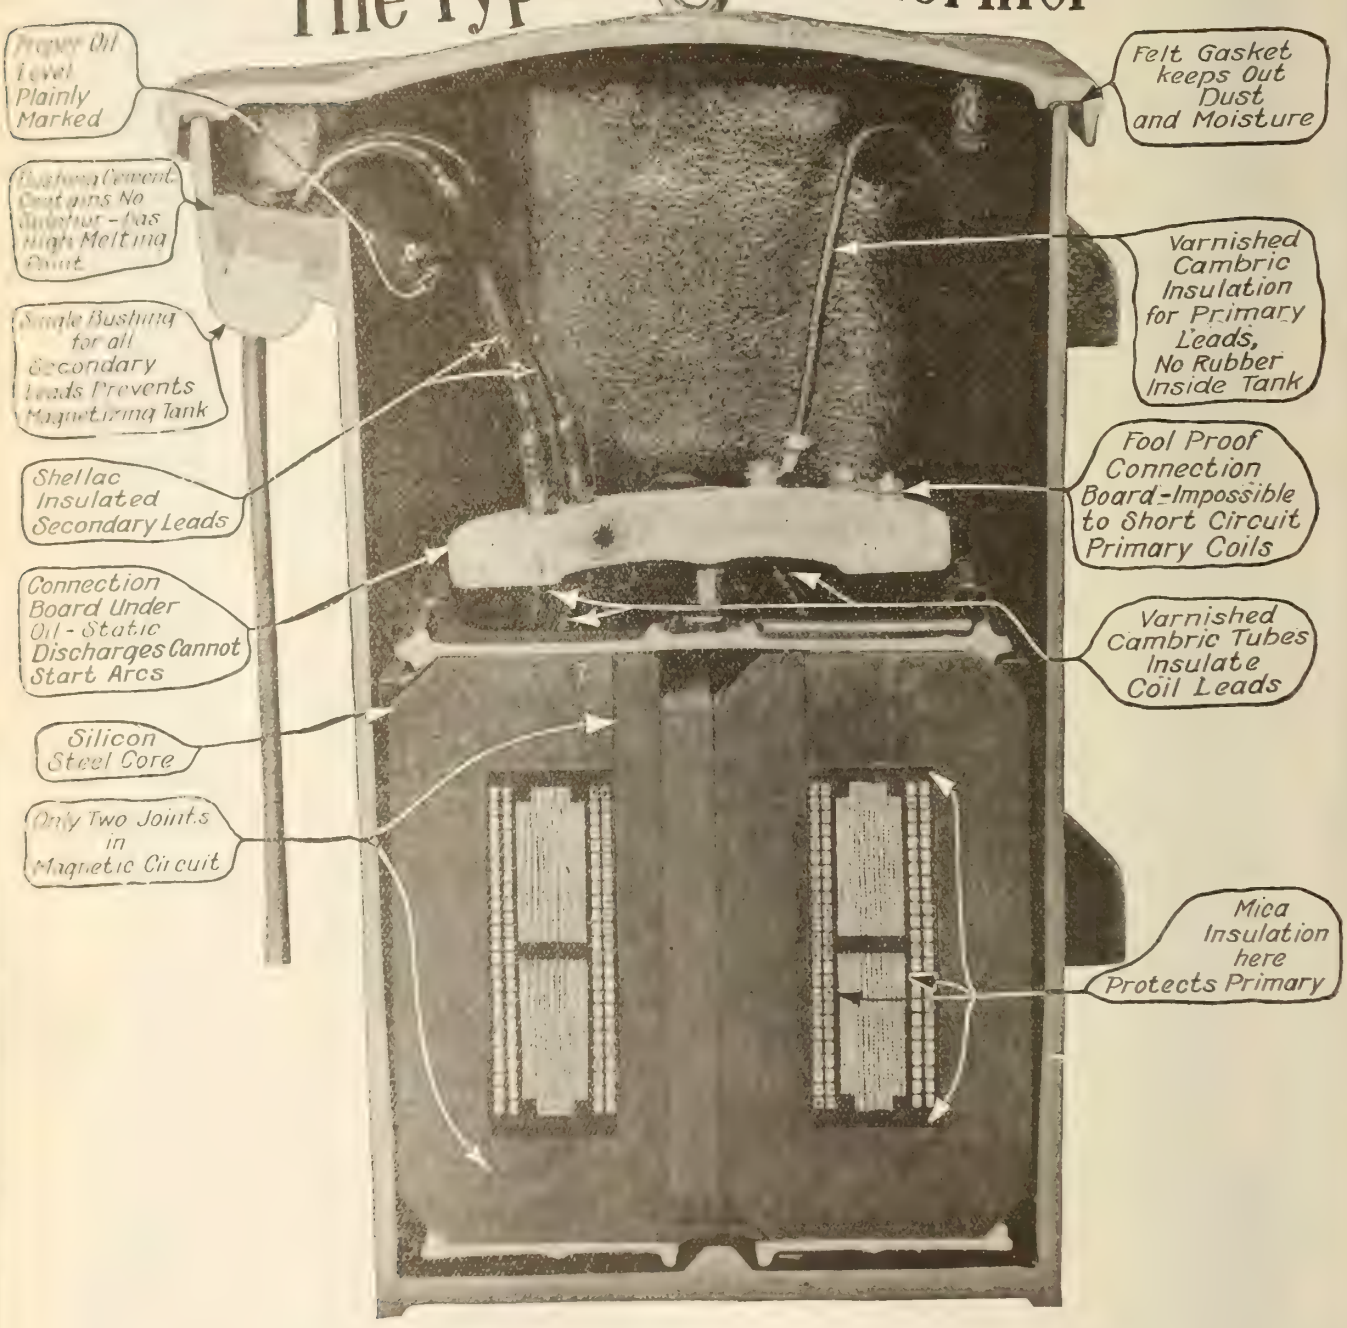
NEVER BEFORE in the history of Canada has greater opportunity been offered her Sons and Daughters to render SERVICE to the Empire;—and

NEVER BEFORE have the needs of the Empire demanded as high a standard of QUALITY in thought, deed and product as at present.



HOW NOBLY CANADA has responded is now known around the World and history will record it for the future.

THE PRODUCTS OF OUR MILLS are at the Fronts and on the Seas, in the Shipyards and Factories and in the Fields, faithfully fulfilling their mission of reliable performance wherever the Government's War-Winning Programme directs, as we are, and have been, stripped for action since the first call to arms.



THE NEEDS OF THE EMPIRE are many and the War-Winning Programme changes as necessity demands; but it matters not, the needs of the Empire are paramount and must be supplied.

THEREFORE, if in these trying times, we do not deliver promptly to you such of the products of our Mills or Blast Furnaces as you may need, console yourself with the thought that through us, you are rendering Service to the Empire and to the Cause that matters most for the Liberty, Justice and Freedom of the World.

CANADIAN GENERAL ELECTRIC CO.

LIMITED

Head Office: Toronto. Sales Offices: Montreal, Quebec, Halifax, Sydney, Ottawa, Cobalt, South Porcupine, London, Winnipeg, Calgary, Edmonton, Nelson and Vancouver.

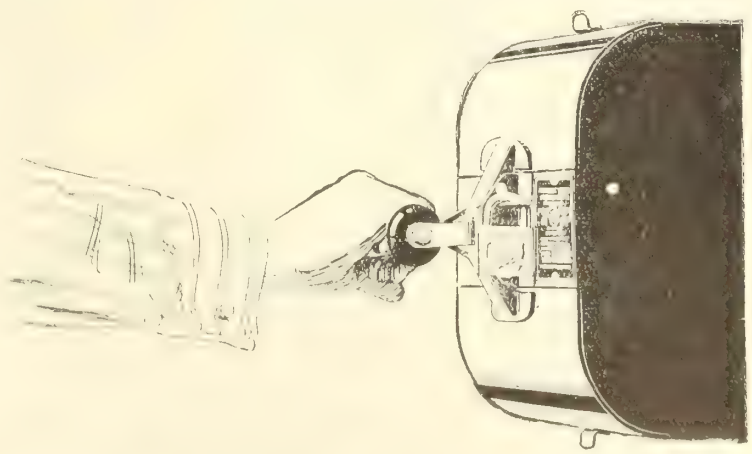
No. 5400
DEPENDABLE PULL CHAIN SOCKET

Approved by the Inspection Department of the Hydro Electric Power Commission of Ontario.

ADVANTAGES:

Quick, Positive Break

Equipped with Arc Eliminator



A Quality Device at a reasonable price

The Socket with the Switch Mechanism

1038 MOTOR STARTING SWITCH

The CR-1038 Switch is used for connecting small A-C. motors directly to the line, and is suitable for use with motors up to and including 3 h.p., 110 volts; 5 h.p., 220 volts; 3 h.p., 440 volts, and 3 h.p., 550 volts.

A push opens and a pull closes this A.C. Motor starting switch. You can't open a cover unless the switch is open, and you can't close the switch if a cover is open. A new type of protective plug guarding the Motor against over-loads gives a time-limit feature and is renewed at remarkably low cost.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057 OI

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the **Underwriters' Laboratory** under the direction of the **National Board of Fire Underwriters** and every coil carries their label.

We will be glad to send you a sample.

Both Appreciate R & M Quality When Selecting Motor-Driven Household Devices

Whether the husband or wife makes the actual purchase, the dealer is sure of the good will of both when he sells household helps which are equipped with ROBBINS & MYERS MOTORS.

The record of R & M equipped devices in use is invariably a record of efficient reliable service.

And this fact is generally known to men and women everywhere. For a decade the R & M Motor has been advertised consistently to the general public through the leading popular magazines. R & M Motor Quality is known to nearly all men and women who are prospective purchasers of motors or motor-equipped devices.

The R & M Motor on any device, whether for home, office, store or factory, is a known product which speaks for the quality and reliability of the machine.

Leading electric-driven devices of all kinds can be obtained with R & M Motor Drive. Dealers find such machines easy, profitable sellers.

Vol. 27 Toronto, July 15, 1918 No. 14

Fixation of Nitrogen Off-peak for Smaller Plants

The need of the present moment is explosives and of the immediate future, in Canada at least, is fertilizers. For both of these nitrogen, in one form or another, is essential, which seems to make the problem of the fixation of this element from the atmosphere one of the most important both present and future.

There are different methods of capturing nitrogren from the air, but the simplest is by the arc process. For this process a considerable amount of electric power is required and the cost of this form of energy has, in the past, been the chief obstacle in the way of its greater use in this industrial development. However, the present is no time to consider low cost as a first essential. The main thing would seem to be expediency and, for this reason, it would appear that the fixation of nitrogen by the arc process is not receiving the amount of attention it deserves. With the uncertain state of ocean transportation it surely is not wise to depend entirely on the Chile beds, which represent the main source of nitrates to the Allies, especially when there are coal and water resources in abundance lying idle which could be readily utilized, to say nothing of spare generating capacities at numerous Canadian points. Why not utilize these dormant powers to the discomfiture of the enemy, both during and after the war?

At the recent convention of the A.I.E.E., held in Atlantic City, Mr. E. K. Scott read a paper on "Electric Power for Nitrogen Fixation," in which the points in favor of the use of the arc process at numerous points throughout the country were forcibly presented. He explained the simple working of this prcess, the possibility of using it at off-peak hours without loss of efficiency, the advantages of establishing comparatively small plants at numerous favorable locations and the improvement in load-factor which would follow to the central station. The paper also points out that this process works in admirably with a coke-oven plant to produce ammonium nitrate. This latter suggestion may well prove a valuable lead to Canadian operators who have large areas of coking coal at their disposal. Extracts from this most interesting paper appear elsewhere in this issue.

Public Control with Private Operation

It is understood that General Manager Kidd, of the British Columbia Electric Railway Company, which supplies transportation, light and power to Vancouver and vicinity, is making an offer to the city council whereby the system shall be operated at cost, the company merely acting in the capacity of administrators—as Mr. Kidd puts it: "The citizens would control and the company would operate." The idea evidently is that the rates would be placed on a floating basis as is done in one or two cases in the United States. A schedule of rates is arranged which are temporarily on trial. If at the end of a pre-determined period there is just sufficient to cover operating expenses, reasonable interest on investment, depreciation and sinking fund charges, the rates stand for another similar period. If there is a deficit the rates are graded upwards; if a surplus, the grading is downwards.

Even the strongest advocates of municipal ownership should see much in favor of such an offer for, in effect, the only difference between that and municipal ownership in its purest form is that in one case the company receives the interest on the investment for distribution to the bond and shareholders, while in the other it is paid direct to the bondholders. Further, the arrangement of public control and private operation is a combination that is believed, by many students of the subject, to be the best solution of the present situation—it is the average between the two extremes. Excellent as the theory of municipalities owning their own utilities may be, there is no doubt whatever that it has been a fatal policy for many of our cities and towns throughout Canada, who, in their endeavor to avoid the evil of uncontrolled private ownership, fell into the trap of uncontrollable municipal ownership.

There is evidence, however, that all over Canada, having now had experience with both evils, we are sitting back and taking a survey of the whole situation with a view to effecting a compromise that will include as many as possible of the good points and as few as possible of the bad points of the two tried systems. Mr. Kidd's offer to the Vancouver municipality seems to be coming pretty near the mark.

Electric Truck Operating Costs Data

In selecting transportation equipment, sentiment, likes and dislikes, fancied or otherwise, should play a very small, if any, part. Transportation engineering—for transportation is an engineering problem, and should be approached like any other science—should be applied, particularly if most economical and efficient results are to be realized.

In the final analysis, the real test of a truck's value is its service record for a period of time sufficiently long to meet both good and bad conditions. A single, one-day demon-

stration under ideal conditions is not broad enough. It should take at least a month of steady work to prove the real qualities of a truck, and bring out all its weak points, if any.

Following is a record of a 750 lb. electric truck used in ordinary city deliveries for thirty working days. Compare with horse drawn and gasoline truck costs to fully appreciate its true value

Days operated		30
Miles traveled		1140.5
Kilowatt hours used		319.5
Number of miles per kilowatt hour		3.57
Greatest current consumption for 1 day	kw.h.	13.
Smallest current consumption for 1 day	kw.h.	10.
Average current consumption for 1 day	kw.h.	10.65
Shortest run	miles	33.5
Longest run	miles	46.5
Average run	miles	38.01
Greatest merchandise load (overload of 750 lbs.)	lbs.	1,500
Smallest merchandise load	lbs.	500
Average merchandise load (overload of 250 lbs.)	lbs.	1,000
Current cost per car mile at 3c per kw.h.		$.008
Current cost per car mile at 4c per kw.h.		.011
Current cost per car mile at 5c per kw.h.		.014
Maintenance (maximum estimate) including repairs and renewal of all mechanical and electrical parts, including tires, battery, and painting of wagon should not exceed, per car mile		.04

Power Situation in Great Britain to be Under Control of Five Commissioners

Troublesome as the power situation has been at certain points in Canada it is easily understood that in the British Isles, where the demand has been so much greater and more insistent and where, besides, there are few large water-powers, the need for conservation has been much greater. Conditions governing operation are different, too, in England, in that there are very few long-distance transmission lines, each small centre operating its own plant by coal, and as the result of this absence of interconnection, it is not possible to utilize excess power which may be lying idle in one town for manufacturing purposes in another town. Also, as often happens with old steam plants, no doubt just as it is in Canada, the efficiencies become very low and much more coal is consumed than should be allowed.

In order that a careful study may be made of the power situation in England and some constructive recommendations based upon the results of these studies offered in solution, the British Board of Trade recently appointed an Electric Power Supply Committee "to consider and report what steps should be taken, whether by legislation or otherwise, to insure that there shall be an adequate and economical supply of electric power for all classes of consumers in the United Kingdom, particularly industries which depend upon a cheap supply of power for their development." Representative associations throughout the country were invited to give evidence and the Committee has now brought in a recommendation that five electrical commissioners should be given complete control, one commissioner to each of five districts, and that the existing system under which electricity is separately generated for small areas should be abolished, utilizing larger units from which the various municipalities should buy their power. Briefly, the recommendations may be summarized as follows:

(a) That a new body, to be called the Electricity Commissioners, should be set up, to whom should be transferred the existing powers of the Board of Trade, Local Government Board, local Government Board for Ireland, and Scottish Office, relating to the supply of electricity, and to whom large additional powers should be given for regulating and encouraging the generation and distribution of electricity.

(b) That the Electricity Commissioners should, subject to an appeal to Parliament in certain cases, have general control over the generation and distribution of electricity in the United Kingdom.

(c) That the existing system under which electricity is separately generated for small areas should be abolished.

(d) That the Electricity Commissioners should; after local inquiries, divide the United Kingdom into districts technically suitable for the economical generation and distribution of electricity.

(e) That in each electrical district a District Electricity Board should be set up which should purchase all generating stations of authorized distributors, whether local authorities, companies, or power companies.

(f) That the District Electricity Board should be responsible, by themselves or their lessees, for the future generation of electricity in their district and for the establishment of new generating stations and proper systems for the main transmission of electricity in their district.

(g) That existing electrical undertakers should, if they so desire, retain their power of distributing electricity within their local areas, but should purchase electricity in bulk from the District Electricity Boards or their lessees, due provisions being made for controlling the profits of of distributors so as to ensure a cheap supply of electricity to consumers.

(h) That District Electricity Boards should make no divisible profits.

(i) That District Electricity Boards should be financed, in whole or in part, by funds raised with government assistance, except where it is shown to be desirable and practicable to finance the boards locally.

(j) That largely extended powers should be granted for, inter alia: (a) The use of overhead wires: (b) wayleaves; (c) acquisition of water rights.

Daylight Saving in Canada Has Not Had Revolutionary Effects

Central stations everywhere in Canada viewed with some trepidation the introduction of the daylight-saving scheme. Being an entirely new departure here they were unable to form any reasonable judgment as to its probable effect on the load factor or the revenue. However, we have now had an experience covering over two months and, for the most part, we can say that nothing very much out of the ordinary has happened. Recently, with a view to gathering the results of experiences to date, we addressed enquiries to a number of the prominent private and municipal operating organizations asking what noticeable effect the change had made on their load factor. From a large list of replies it would appear that no very great loss in revenue has been sustained nor is there, in general, any appreciable change in the load curves. Perhaps under normal conditions the effect would have been more evident, but owing to war business, the load in the majority of cases has not only been greatly increased, but also has entirely changed in its characteristics so that it is impossible to compare, say, June of 1918 with the corresponding month in 1917—about the only reasonable basis of comparison. The replies, however, are interesting from an operating standpoint, and we quote a number of extracts from the letters received:

1. We cannot trace any great change in our load curves. On the other hand, we certainly notice it on our financial statement. It is my opinion that daylight saving will affect the lighting-revenue from 15 per cent. to 20 per cent., and we

will need to sell lots of irons and apparatus to coax the elusive dollar.

2. On account of the short time during which daylight-saving has been in operation, it has not yet been possible to analyse the effect of this change of time.

3. In so far as our plant is concerned it is somewhat difficult to determine with a fair degree of accuracy to what extent daylight saving reduces the load factor.

In the first place, it is difficult to make a comparison of our load curves of last month with those of the same month a year ago as the load conditions have undergone value. A comparison of the curves for the first month that daylight saving was in force with those of the month previous is also of little value, because the change in load conditions at that period of the year are so rapid that little information would result from this comparison. However, we find by taking the totality of kw. hours supplied for lighting purposes for February and March that they are practically the same as the kw. hours supplied for the same months a year ago. On making the same comparison for May we find a reduction of approximately 32 per cent. This 32 per cent., I believe, represents approximately the effect of daylight saving on the current supplied for lighting purposes.

4. Our lighting load and any load that would be affected by daylight saving is so small in comparison to our other load that daylight saving has no affect on the load factor of our station.

5. We are unable to supply this information with any degree of accuracy owing to the fact that while our lighting load shows a falling off this is more than offset by the gain in power sales, so that there is but a very slight change in our load factor. It is also a difficult matter to make comparisons from revenue because our rates for electric light and power now in force are considerably lower than the rates prevailing during the corresponding period last year.

6. The "daylight-saving" is noticed very little in our plant. The reason for such would be that the streets are lighted by natural gas, all the houses are piped for natural gas and have been for years before the electric light plant was installed. With natural gas at 15c per 1,000 cubic feet, and electricity at 6c per kw.h., long hours of daylight in Western Canada, puts us in a position that the extra lighting load could scarcely be read at our switch board.

7. It is a very difficult matter for us at the present time to determine what the effect on the load factor has been, owing to the abnormal demand for power for munition purposes. We are looking over our station records endeavoring to segregate the purely residential districts from the others, with a view to obtaining the load factor on these circuits before and after the new bill came into operation.

If the information thus obtained furnishes any data of interest we will be pleased to forward it to you, but, as stated above, we are unable to determine what effect the new bill has had on the load factor of the total system, due to the increase at the present season in the demand for power for munition purposes.

8. We are unable to find that it has had any effect whatever upon our load factor.

9. We are not in a position to compare our load curves as to effect of "daylight-saving," owing to the variation on power load.

10. On acount of the load being so much under control, due to the shortage of power, our charts do not show the saving due to the change in the clocks.

11. We have pleasure in enclosing typical lighting curve, which we believe will give you the information you require for your article. As noted on the curve, the lighting load increased 10.5 per cent., but the peak is reduced 8.3 per cent., which demonstrates the effect of "daylight saving".

12. Our load is largely a power one and as yet we can notice very little difference. In fact we are all very much pleased with the "Daylight Saving" and would like to see it carried right through the year. We believe in the fall of the year it would reduce, if not wipe out altogether, the severe overlap of light and power between 5 and 6 p.m. If we could be relieved of this overlap we think that it would more than compensate us for any reduction in the demand for light.

What Will Become of Canada's So-called Industrial "Prosperity" When the Orders for War Materials Stop Coming?

It has been said that Canada's industrial condition today is better described as "active" than as "prosperous." That is to say, a business which is more or less temporary, as this war business must be, does not represent a real stability and prosperity as we interpret this term in normal times. This condition may last five years or it may only last as many months and it is nothing more than common, everyday horse-sense to ask ourselves what will happen, industrially, when the war is over.

Statistics show that Canadian exports in 1917 exceeded those in 1913, the last year before the war, by something over one billion dollars. This was made up roughly of 40 per cent. agricultural and 60 per cent. manufactured products. It may reasonably be argued that the 40 per cent. of agricultural export will still be required after the war, and much more, but the same is not true of the 60 per cent. made up of manufacturers. It is plainly an urgent question then as to how our manufacturers are going to weather the inevitable slump. There will be ample labor, ample raw material and, to all appearances, ample capital, but where will the orders come from?

Our captains of industry are not indifferent to these conditions and have a worthy leader in Senator Frederic Nicholls, president and managing director of the Canadian General Electric Company, who has repeatedly raised his voice in warning during the past two years that we must be prepared for the future. Senator Nicholls has championed the cause of the manufacturers in the Canadian Senate where it is safe to say his forceful and unanswerable arguments on international trade questions have made him the outstanding figure of the past two sessions. Nor has he been satisfied to rest the matter there. Before meetings of the Manufacturers' Association and in the financial and technical press he has advanced telling arguments in favor of a definite, thoroughly organized plan of co-operation between the manufacturers and the government, to the end that the export trade of the Dominion may not suffer with the cessation of war orders.

Senator Nicholls makes a strong point when he calls attention to the recognized adaptability of the Canadian manufacturer to new conditions. He recalls that very high officials in the British War Office stated that Canada had shown greater adaptability in the matter of munition manufacture than even the Motherland. He naturally concludes that there should, therefore, be no sound reason why we cannot adjust ourselves, to whatever extent it may be necessary, to after-war conditions.

Senator Nicholls is now addressing himself to the general press of the country and asking for co-operation. During the past few days, letters, of which a copy is reproduced below, have been sent out to the newspapers and there is little doubt they will give it their hearty support. In years to come when Canadian manufactured products shall have become as commonly known the world over as were German products before the war, it will not be forgotten that the success

largely due to the courage and persistent energy of this man who has never lost confidence in the ultimate triumph of Canada as a great export manufacturing world power.

Senator Nicholls' Letter.

212 King Street West, Toronto,
June 21, 1918.

Dear Sir,

I venture to direct your attention to a matter in which the newspapers may render a great public service.

At present this country is exceedingly prosperous by reason of the balance of trade which is so greatly in our favor. When the war is over, and our exports of munitions and war materials to the value of over a billion dollars yearly shall have ceased, we will be left with huge financial obligations the cost of our share of war expenditure, and unless we prepare and are ready to meet the changed conditions, we will be face to face with the most serious financial situation that Canada has yet experienced.

The responsibility of sounding a note of warning and also a call for action lies with the newspapers of Canada, which are the educators of the public in regard to conditions as they may arise, and I submit that next to winning the war the most important problem before the Canadian public is the question of preparedness for adverse conditions that must arise following the conclusion of the war.

The interest and sinking fund charge per capita on our national debt has increased from $1.70 to 1913 to $10.00 at present, or over five hundred per cent. in four years, and is still increasing, and the Reconstruction Committee of the Federal Cabinet should be urged to initiate some policy designed to offset the shrinkage of exports of agricultural, manufactured and natural products which will most certainly diminish as soon as the war ends.

The farmer, the lumberman, the manufacturer, the miner, the financier, the mechanic and the laborer, in fact every class of the community, are directly concerned, and the press of the country can render great public service in urging the importance of preparedness and the mobilization of our national resources in an efficient manner.

I enclose herewith some facts and figures* which have been carefully compiled.

Yours faithfully,
Frederic Nicholls.

*Pamphlet containing reprints of addresses and discussions on this subject in the Canadian Senate, and articles written by Senator Nicholls for the Technical Press.

Annual Meeting Montreal L. H. & P. Co.

The gross revenue of the Montreal Light, Heat & Power Consolidated for the past year was the largest in the history of the company, said Sir H. S. Holt, at the annual meeting on June 5. This was due in part to the demand for power by the munitions companies and also to the high prices received for by-products. There was no reason to look for any slackening of this demand for electrical energy as plants formerly engaged in munition work were already taking up other lines of business and continuing with electric power.

As to the amount written off for depreciation, the president explained that this was necessary, and stated that no company in Canada, and but few in the United States, provided so liberally for depreciation as did their company. Old engines that were in use a few years ago have been thrown aside for more economical ones.

The demand for power had necessitated the installation of two new units at Cedars, which would be in operation by September.

The price of gas and electricity in Montreal was the lowest in America, but if materials and taxes continued to advance, the company would be forced to increase the cost of the commodities it sold.

Winnipeg Municipal Electric Display

At the recent convention of the Retail Merchants Association, held in Winnipeg, the Municipal Light and Power Department had an attractive display. The decorations of the exhibit were white trellis woodwork, back and sides covered with creeping nasturtiums, the whole effect being light and attractive to the eye. An interesting contrast was shown between the old and modern methods of cooking by an electric range in the centre with a coal range and a gas range on either side of it. The former had a display of coal, wood and ashes ticketed up "Coal to carry," "Wood to Chop," "Ashes to clear away." On the gas range there was the following show card:

YOUR MONTHLY GAS BILL!
WILL YOU LET ELECTRICITY CUT IT IN HALF?

A few examples of how electricity has saved money for other citizens of Winnipeg—why not you?

	Monthly Gas Bill	Monthly Electric Bill
Mr. Frank Wiley, 64 Middlegate....	$10.00	$4.50
Mr. F. K. Herchmer, 986 Grosvenor..	9.00	3.08
Dr. Christie, 150 Canora	8.00	2.50
Dr. Fletcher, 220 Elm	5.85	1.76
Mr. J. Swan, 605 Alfred Ave.	3.50	1.60

This card gave the salesman a strong talking point. They also had a display of other electric cooking ranges, heaters, water heaters, show cards, etc. The visiting merchants, as well as the general public, were much interested in the display, and the management are confident the exhibit will prove a beneficial advertisement for future business. The exhibit was in charge of Mr. R. A. Sara, sales manager.

Promotion by Merit

Our Union Government has given evidence of their sincerity regarding the abolition of the patronage system in the promotion of Mr. W. E. Lemon to the City of Toronto postmastership. It is true Mr. Lemon is eminently fitted for the post, but this, in the past, has not been considered sufficient qualification when in competition with importune politicians who have had to be provided for. It is to be hoped the old system has gone forever. Without doubt the appointment of Mr. Lemon will have a beneficial effect throughout the Canadian Civil Service, the members of which will see in it a recognition of the principle that merit and devotion to duty are to be determining factors in selecting men for positions of greater trust.

Prize for Paper on Co-ordination of Research in Works and Laboratories

The Council of the Institution of Electrical Engineers are prepared to receive papers on the subject of "The Co-ordination of Research in Works and Laboratories," with a view to the paper being read and discussed at one of the ordinary meetings of the Institute in London and also before one or more of the local sections.

Papers should not exceed 15,000 to 20,000 words in length, and the Council are prepared to award a special premium of £25 to the author of the paper which in their judgment best fulfills the objects of the discussion, provided such paper reaches the standard aimed at by the Council.

Papers should be sent to the secretary of the Institution not later than the 4th November, 1918. It is the intention of the Council to publish the selected paper (which will become the property of the institution) in the Journal, together with the discussion. Competitors intending to submit papers are invited to communicate with the secretary.

Electric Power for Nitrogen Fixation

Production by Arc Process Has Merit of Simplicity and Low Cost for Fquipment—Off-peak Output of Small Plants May be Utilized

By E. Kilburn Scott*

One of the most powerful combinations in the world is that connected with the exploitation of Chile nitrates, and to extend the uses of that material and regulate prices, etc., there is a Chile Nitrate Committee supported by the various interests concerned.

It was created for propaganda work amongst farmers and others, to facilitate the use of nitrate as a fertilizer but since the advent of air nitrates some attention has been given to discrediting the methods of fixing nitrogen from air. This has been done partly by paragraphs in the press throwing doubt on the financial and technical success of such methods, etc. German influence, working through political clubs and the press, also assisted the Chile nitrate propaganda while at the same time German scientists were being assisted in every possible way to develop air nitrate processes in their own country.

Years before the war, some of us saw the question of supplies of Chile nitrate for the manufacture of explosives would be an important factor, and in 1911, at the Portsmouth meeting of the British Association, and later at a meeting of the Society of Arts in London, I sounded a note of warning.

To show how different the Germans tackle these matters, I may say that when the war started, the German government appointed an electrical engineer, head of the Allgemeine Elektricitats Gesellschaft, to expedite the manufacture of explosives.

On the other hand when the British government started its explosives department a lawyer politician was put in charge, and even afterwards, when a Minister of Munitions was appointed he also was a lawyer politician and had as second in command, a doctor of medicine.

The appointment of politico-legal persons to positions concerned with scientific and engineering matters, has been favorable to Chile nitrate and to German propaganda, in that it retarded developments that would have assisted to make the Allies independent of Chilean supplies.

Even after three and a half years of war, the Allies still remain practically dependent for explosives on supplies which have to be brought thousands of miles. This requires much shipping that might be used for other purposes and also occupies the attention of part of the Navy, in order to keep open the sea routes.

It is to their credit that certain scientists and engineers of this country not only saw the danger, but insisted on the authorities taking action by providing money to establish plants for the manufacture of nitrates.

At the same time, in this country as well as in England, there has been time lost, owing to certain parties manoeuvring to obtain the adoption of their own process to the exclusion of others. In so large a field as nitrogen fixation there must necessarily arise numerous improvements in the various processes so that it is not possible to-day for anyone to gauge or forecast their future relative economic values.

This is particularly the case with processes in which electrical energy plays a leading part for it is a sort of ingrained habit of the electrical engineer to simplify and revolutionize existing methods that they eventually become essentially electrical. The whole history of electrical progress, and especially of electro-chemistry and metallurgy establishes that fact.

I consider that boards or committees dealing with nitrate problems should be largely made up of engineers who have expert first hand knowledge of electrical power conditions and of appartus, etc. Chemists, pure and simple, are useful but they should not have power to pass upon processes in a field which electrical engineering is capturing so completely as the production of nitrates.

In certain quarters there has been too great a readiness to listen to the tittle tattle of propaganda such as hinted of above.

I feel that the merits of the arc flame process for making nitric acid have not been adequately and sympathetically considered, and this paper is written with the special object of stating them. I wish also to remove the misconception that the arc flame process is dependent on water power and that it can only be installed economically on a very large scale. The matter is one of special interest to electrical engineers because the process is essentially an electrical one.

Electric Power.

As a basic load for a power house the direct arc process presents the advantage that it can be established anywhere, because the raw materials being only air and water, considerations of transportation do not enter into the situation.

It is particularly suitable for off-peak or off-season loads, for there is no fused material to solidify, and little to deteriorate in case of stoppage. Some of the furnaces can be switched on and off like an arc lamp, without detriment to brickwork or structural details, or to the process of manufacture.

As there seems to be some doubt as to the possibility of running arc furnaces intermittently on a commercial scale, I would mention that about seven years ago a nitric acid factory was built at Legnano, Italy to utilize 10,000 horse power, especially during the night. Of course this plant has been considerably extended especially since the war. I am also credibly informed that in Germany there is a very large arc process plant working with off-peak power. At any rate there is no difficulty in doing it, whereas it is impossible to work intermittently with any other method of fixing atmospheric nitrogen.

In some ways, it is an advantage to run a plant for 8000 or less hours per year, instead of the full number, because the spare time can be conveniently used for renewals and repairs. Less spare plant is thus required and the plant can be operated by two shifts of men.

Because the plants in Norway are very large and only use hydro-electric power, a mythology has grown up, that the arc flame process can only be worked commercially on a very large scale, and with water power. As a matter fact it is well worth while to build plants of 10,000 kw.

As a matter of fact hydro-electric power may be a disadvantage because of its distance from industrial centres, for either the factory has to be placed in an out-of-the-way position, or else the power has to be transmitted over a long transmission line. I am of the opinion that electrochemical factories should be placed near the power supply, and the

* Before the A. I. E. E.

The Bugbear of Electrical Merchandising is "Inadequately Wired Houses"

The Society for Electrical Development have started out on their advertising campaign preparatory to the Service Week drive they will make in September next. It would seem that this year the Society has struck at the very root of the reason why more domestic appliances are not used in the home and that by concentrating their energies on making it possible to use these appliances, they will get much bigger results, eventually, than they could possibly do by urging the merits of equipment which, in the home of the average householder, is practically useless. By this campaign the Society recognizes the force of the argument that the weak point in electrical merchandizing lies in that overwhelming majority of poorly wired houses for which, in the main, we have the indifferent attitude of the architect to thank. The proper time to wire a house for any electric service, and to instal the necessary outlets is when the house is being erected, but these are essentials in modern home-building that are conspicuously absent from the plans and specifications of ninety-nine out of every hundred buildings. It is to be hoped the forthcoming campaign will, in part, bring this fact home to the architect and the householder alike. In that case it will have served a double purpose.

The first letter in the campaign, which has just been received, is entitled "Save food, fuel, time, money—by wire." A number of good arguments are advanced and, in the main, a strong case is made for more outlets. The following are extracts :

Does the use of electrical specialties actually conserve food, fuel, time and money in the household ?

If so, a broader, more thorough application of such devices must go a long way toward furthering war work. If not, then the figures of household statisticians, as well as the inherent beliefs of millions of housewives who have bought and are buying such appliances, are all wrong.

But that Great Purchasing Agent, the housewife, is seldom wrong in her choice of what will save labor and money in her home, and assuredly not in this case. The remarkable increase in the sale of household electrical appliances and specialties since the war began is not the result of whim, chance or guesswork on the part of that vast army of women buyers. On the contrary, it is worthy of note that the sale of such labor saving devices increases fastest in those territories where the "better half" is most active in Red Cross and corresponding war work.

Said a central station manager recently: "The more time the woman must spend outside of her home, these days, the more she turns her attention to those electrical devices that cut hours of housework off her daily schedule, the quicker she buys them, regardless of price, and the more she depends upon them."

It would be difficult to reconcile the sale last year in the U. S. of more than $10,000,000 worth of washing machines, more than $4,000,000 worth of vacuum cleaners, and more than $7,000,000 worth of other electrical labor saving appliances, with anything but the fact that there is a real and ever growing need for such appliances in the home.

Even the skeptic, who sees the electric washer save the woman a day a week (not to speak of the 60 per cent. saving in linen and lingerie saved by doing away with the washboard) cannot dispute the essentialness of this when he learns that the 200 washers sold each day last year gave the women [illegible] to do with as they wished.

[illegible] in black and white —in actual figures—take pencil and paper and do a bit of figuring in his own home. Start with the job of housecleaning. Twice a year, how many days were given over to dust-pan, mop and broom? Each day, how much dusting, sweeping, beating of rugs and carpets? Then put down against the old method the hour a week (or whatever the small amount of time) used in cleaning the "electric way." It makes no difference whether the servant had to do the work, or the housewife. Servant's time is valuable—and servants are becoming scarcer every day. Let him figure what he might save if his servant could be dispensed with. And many families are supplanting them with electrical specialties.

These are reasons enough for any intensive campaign or propaganda that helps to deliver the message of greater conservation, greater efficiency, greater economy into every home. It will hardly be denied, therefore, that the Society for Electrical Development's Campaign for a broader, better use of electrical household helps strikes a popular chord. It does not matter so much as to how the appeal is made, or what form the educational matter takes, so long as it is built on sane, sober, serious lines, such propaganda cannot fail to produce faithful returns.

The Viewpoint of the Industry

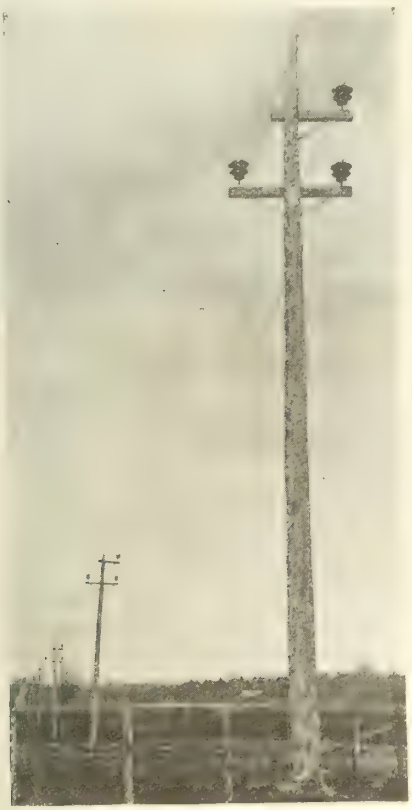
That the electrical industry, in its every ramification, is faced with serious, vital problems today will not be denied. Neither will it be contradicted that the government desires, Neither yill it be contradicted that the government desires, where and when possible, to keep business intact. It would prefer to see every business on a "going basis." It is not saying to the electrical contractor, for instance: "You shall not become an electrical merchandiser," nor does it say "If you have the opportunity to secure construction and installation business that will enable you to keep your business intact, you shall not go after it." It puts the success or failure of each man's business squarely up to each man.

The main problems facing the central station, the contractor-dealer, the electrical jobber and manufacturer require no recountal here. They are too well-known. But it is interesting to study how the forthcoming campaign will benefit each of these branches of the industry. The use of more outlets on the present lines of the central stations need not necessarily result in increased peak. It affords the quickest, easiest means of saturating present lines, of filling the valleys in the 24 hour load, and of furnishing work for salesmen who might otherwise have to be laid off.

For the contractor-dealer it offers the quickest solution of his trouble "where to get business and how." Every service connection he puts into a customer's house (new house or already wired, it matters not) can be made a revenue producer for him, for a long time to come, if he wills it. When electric service goes into the home for lighting, only the first step has been taken. The contractor-dealer, or any electrical merchandiser owes it not any more to himself than the customer, to demonstrate the utmost possibilities of that service. If the electrical specialist does not believe this, he had better take a few days off, and sell himself on his own proposition.

Finally, that which benefits the central station and contractor-dealer must benefit the jobber and manufacturer. Their cooperation in the movement is assured.

A feature of such a campaign is that it automatically adapts itself to any wiring or appliance campaign the contractor, central station or merchandiser may have scheduled for that same period. It will stimulate wiring orders as quickly as it will stimulate appliance sales, even though the drive is concentrated on additional outlets, plugs and receptacles.



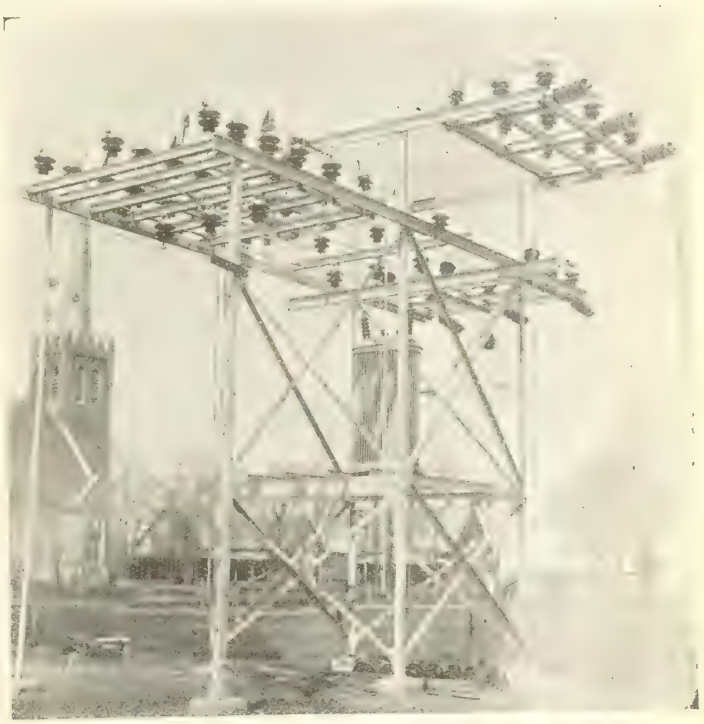
The Bell Telephone Company has moved into a new building at Smith's Falls. It is of the usual type of the company's fireproof structures, specially designed for telephone purposes, and fitted with magneto equipment.

High Tension Work in Quebec Province

Carrying out the policy of extending its system, the Southern Canada Power Company has completed and put into operation a high tension transmission line between Bromptonville and Cowansville, a distance of 78 miles. The line recently underwent a severe test in the way of a very heavy windstorm, and stood up under the strain.

The line passes through a district which has considerable industrial possibilties, and one in which new industries are being located, one reason being that, even in these times of scarcity of labor, there is a fair supply to be obtained. Naturally the availabllity of dependable power is another important consideration, and in this connection experience shows that industries will locate at points where they can obtain this power. Recently a number of copper mines have been opened up in the Sherbrooke & Eastray districts..

The line is 48,000 v. 3 phase, of 5/16 in. steel wire, re-

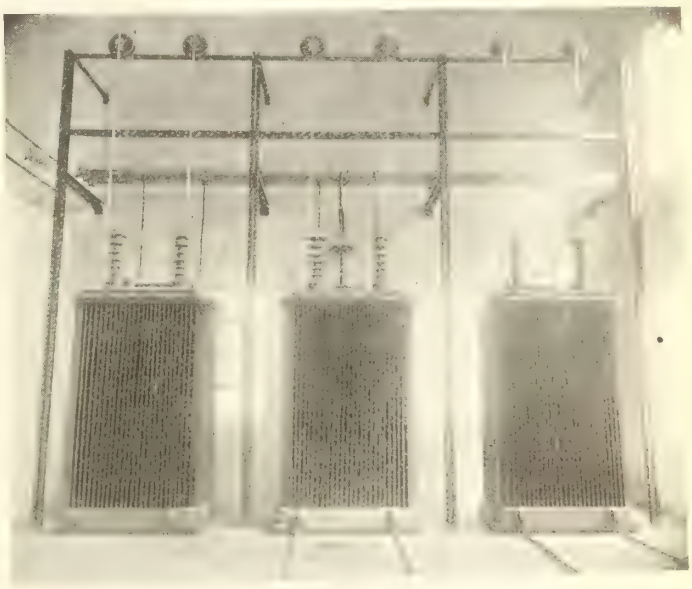


High tension line, leaving Granby.

presenting a departure in long-distance transmission in Canada. The poles are of wood, 35 ft. 7 in. tops, two cross arm triangular type, the 5/16 in. steel ground wire being on a bayonet extension at the top of the pole. A private telephone line is placed six feet below the lower cross arm.

The power is supplied from Sherbrooke, instead of as formerly, from a number of small plants along the route of the line. Sub-stations are located at Foster, West Shefford, Granby, Cowansville, and Bromptonville, with provision for sub-stations at Eastman, Magog, Rock Forest and Adamsville. Various points are equipped with a standard sectionalizing tower and outdoor sub-station, designed for 300 kw.

For crossing the river at Granby two steel towers were erected by MacKinnon, Holmes & Co., Ltd., Sherbrooke.



The insulators are of the pin type, tested for 125,000 volts

Standard Out-door Sub-station—Southern Canada Power Co.

wet flashover test, and were supplied by the Canadian Porcelain Co., Ltd., Hamilton.

Mr. J. M. Robertson, of Montreal, was the consulting engineer.

3-500 kw. 48,000 2400 volt transformers, Granby.

The company is also building additional high tension transmission lines connecting the new development at Drummondville with the city of Sherbrooke and with St. Hyacinthe.

A deputation from Perth, Ont., which recently waited on the Hydro-electric Power Commission of Ontario, was assured of almost immediate deevlopment at the High Falls site, recently purchased by the Commission. The work will involve an expenditure of between $300,000 and $400,000.

Electric Deliveries of Coal

By A. Jackson Marshall

Even although we are credited with relatively short memories the vicissitudes of last winter, particularly those resulting from scarcity of coal, have been too indelibly stamped on our minds to be rapidly eradicated by a few days of warm weather. Besides, there is another winter coming and there are no assurances that it will be free from vexing coal problems. Therefore, having had one series of severe lessons, and with prospects of others likely to be encountered, it behooves us to take such steps as may be necessary to adequately fortify ourselves, and one of the most important phases of the coal situation which may be anticipated and provided for is that of transportation, particularly in the delivery of coal from the railroad cars to place of consumption.

The horse, heretofore the most popular motive power, is rapidly being shown to be a liability rather than an asset, and while such means of locomotion may be called upon in emergency, the far-sighted and progressive coal dealers are rapidly discarding such inefficient motive power for the tireless, dependable, sturdy and economical motor truck; and many dealers who have approached their delivery problems from a transportation engineering basis, have selected electric trucks which have proven most satisfactory in service.

An interesting comparison of the performance of an electric truck and two gasoline trucks operated in Boston, follows: Three trucks were employed on a contract for coal to be delivered to the State House on Beacon Hill. The round trip from the loading platform was 3.7 miles, conditions of loading and unloading were exactly the same, and the time constituted a full day's performance for each truck. The "electric" was a six-ton unit, while the gas trucks were five-ton, and four and one-half ton, respectively. The five-ton gas truck delivered 49 tons of coal in 12 trips; the four and one-half ton gas truck 40 tons in 13 trips, and the six-ton "electric" 86 tons in 13 trips. The actual running time of the electric truck was from 7:12 in the morning until 4:40 in the afternoon, with one-half hour out for lunch. It will be noticed from these figures that the "electric" was consistently overloaded, and that both gas trucks were underloaded. The battery of the electric truck was "boosted" once during this period.

Electric Hauled Twice as Much.

It is interesting to note that the two gas trucks hauled practically the same amount of coal during the day that was hauled by one electric truck. That this was not a freak performance of the "electric" is evidenced by the fact that the next day the "electric" carried 12 loads of 78 tons, and the following day 12 loads of 76 tons, making a total of 240 tons in three nine-hour days. This same "electric," a few days later, on shorter hauls, delivered 123½ tons of coal in 19 loads, leaving with the first load at 7:12 a.m. and finishing at the garage at 5.05 p.m., with about ¾ of an hour rest at noon. The loading time was six minutes per load, and the actual miles covered were 26½. The company operating these trucks estimates that their per diem cost on the gasoline trucks is from 50 to 70 per cent. greater than it is on an "electric."

Follows some data on operating cost for coal delivery which was the result of four years' study and research work along these lines by the Massachusetts Institute of Technology. In studying these figures it should be borne in mind that they are average costs covering several large installations that have been in operation for a number of years.

Estimate for Coal Delivery (5 ton rating).

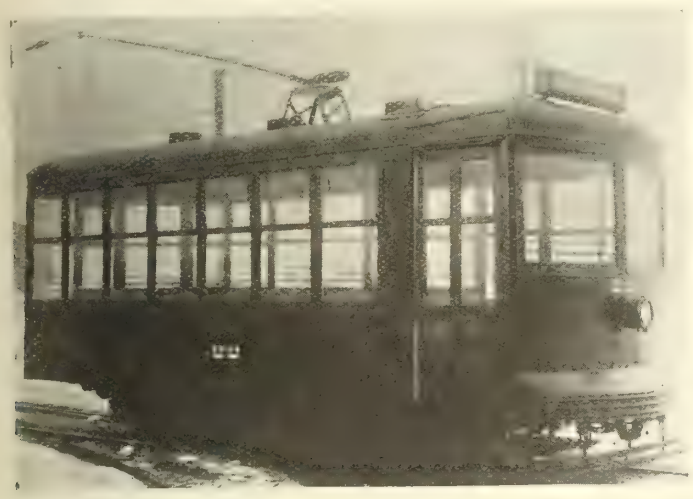
Average maximum load, approx.	10,000 lbs.
Mileage per trip	6
Hours per trip for loading	0.2
Hours per trip for unloading	0.7
Hours per working day	9.0

Vehicles	11,000 lb. Electric	10,000 lb. Gasoline	3-Horse wagon 2 Extra horse
Average running speed, miles per hour	6.	7.5	3
Hours per trip, standing	0.9	0.9	0.9
Hours per trip, moving	1.0	0.8	2.0
Hours per trip, total	1.9	1.7	2.9
Average no. trips per 9-hour day.	4.7	5.3	3.1
Miles per day	28.0	32.0	18.5
Tons delivered per day	23.5	26.5	15.5
Days used per year	295.0	270.0	285.0
Vehicles miles per year	8000.0	8600.0	5300.0
Tons delivered per year	6700.0	7150.0	4400.0

Expense—Annual.

Tires or shoeing, etc.	$400.	$520.	$175.
Repairs	300.	700.	100.
Battery	440.		
Veterinary			30.
Lubricants	15.	70.	
Electricity at 3c per hw.h.	290.		
Gasoline at 16c per gallon		430.	
Feed			900.
Garage or stable	270.	270.	335.
Driver and helper	1210.	1280.	1210.
Depreciation	400.	760.	
Interest	135.	150.	45.
Insurance	150.	200.	40.
Total annual expense	3610.	4380.	3135.
Cost per day	13.30	16.20	11.00
Cost per ton delivered	.54	.61	.71
Cost per mile	.45	.51	.59

It should be noted that in the above rating the price of gasoline is quoted at 16c per gallon, which is considerably below the present price, and would greatly affect the total yearly expense given of $430.



While economy and efficiency both favor the "electric," as the above statements show, there is still another factor which we have not considered and that is the humane element. Anyone who has ever watched a struggling team of horses hauling a 4 or 5-ton load of coal over wet pavement, or an icy road, or who has seen them strain every muscle, with heads bent nearly to the ground in the effort to haul this load up a steep hill, has probably been impressed with the thought that the requirements of modern haulage demand something more powerful than the "animal motor." While buildings have continued to increase in size and the demand for fuel has grown in proportion, many dealers have continued to use the same delivery methods that were used a decade ago when the horse was quite capable of performing the necessary labor. But to-day, when a commodity such as coal must be supplied in such great bulk, it is not only uneconomical to use horse equipment, but inhumane and illogical.

The simplicity of operation is also an argument for the "electric" as it does not require a skilled mechanician for a driver, and its necessary repairs are slight and infrequent —a feature of considerable importance these days of de-

pleted man-power and scarcity of machined repair material. In this connection it is noted from a report from the Glasgow Cooperative Society (London) that one of their three-ton electric coal trucks was out of commission one afternoon and the following morning during an entire year (307 working days) thus attaining a reliability coefficient of 99.65 per cent.

Three Rivers Safety Car

Herewith we illustrate the light safety car in use on the system of the Three Rivers Traction Company, Three Rivers, Que. It derives its name in part from the device by which the car is brought to a standstill in the event of the motorman taking his hand off the controller. The power is then automatically shut off and at the same time the doors of the

car are opened. In case of an accident to, or sudden illness of, the motorman, there is no danger of the car getting out of control. The car is of the one-man, pay-as-you-enter type; will seat 30 people and is fitted with an automatic sander. It was manufactured by the St. Louis Car Company, St. Louis.

Public Service at Cost

The Buzzer, the breezy little pamphlet distributed by the B. C. Electric Ry. Co. among its patrons, puts the whole matter of increased costs and fixed revenue of central station companies in a nutshell, as follows:

Public utility service at less than cost cannot go on indefinitely.

Cost includes the cost of operation and a fair return on the investment.

Public service commissions agree that in order to safeguard the public service, companies must receive sufficient to pay the cost of operation and a return on the investment sufficient to attract new capital.

Whether in the railway or the light and power department, service at less than cost means that the public service will suffer.

The Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., has purchased the property, business, and goodwill of the Krantz Manufacturing Company, Inc., Brooklyn, N.Y., manufacturers of safety and semi-safety electrical and other devices, such as auto-lock switches, distribution panels, switchboards, floor boxes, bushings, etc. The Supply Department of the Westinghouse Electric & Manufacturing Company will act as exclusive sales agents.

Women Drivers in Scotland

An interesting table appears in a recent issue of the Tramway Journal with regard to the number of women employed as tramcar drivers in Scotland, and showing the numbers of women employed as drivers and conductors on all Scottish undertakings. The percentage of female drivers is 18-6 and of male conductors, 13.

M. & S. C. Want Higher Rates

The Montreal & Southern Counties Railway Company has applied to the Railway Commissioners for authority to increase the passenger and freight rates. For the company it was submitted that the same reasons existed for increases in the case of electric railways as in the case of steam railways, and that as one had been granted there was equally good reason for the granting of the other. The united municipalities served by the lines of the company strongly opposed the application, mainly on the ground that under contracts entered into in 1909 it was agreed that the present rates and charges should stand for 20 years. The municipalities argued that this contract should be respected. Judgment was deferred.

Winnipeg Railway Changes

A reorganization of the traffic department of the Winnipeg Electric Railway is announced. There will in future be three divisions—central, south and north. Mr. C. Colwell, formerly chief inspector of traffic, has been appointed superintendent of the central division and J. S. Beckwith and M. Flood, formerly travelling inspectors, will have the north and south divisions respectivley. The divisional superintendents will have charge of the operation of all cars on their divisions and will be responsible to Mr. R. R. Knox, traffic superintendent. The company have also in view the establishing of an instruction department for new men.

The Levis County Railway, Levis, Que., intend making improvements to their track equipment. When the line was built no ballast of any kind was provided, the rails being laid on ordinary country road without drainage. The line will now be ballasted with stone; rails and ties will be replaced and necessary grading carried out.

Personals

Mr. S. A. Neilson, resident engineer of the Hull Electric Co., has been elected a junior member of the Engineering Institute of Canada.

Mr. R. G. Black, for the past four years the member of the Toronto Hydro-Electric Commission representing the provincial commission, has resigned that office.

Mr. J. A. Burnett, electrical engineer, Grand Trunk Railway System, Montreal, has been appointed technical assistant to the British War Mission at Washington.

Mr. Herbert J. S. Dennison, patent attorney, has announced his change of address from the Star Building, 18 King Street West, to the Kent Building, Yonge and Richmond Streets, Toronto.

Mr. W. Nelson Smith, electrical engineer, with twenty-five years' experience in many electric railroad centres of the United States, has recently joined the staff of the Winnipeg Electric Railway Co. He will make a study of matters affecting power requirements and distribution, paying particular attention to the elimination of electrolysis.

Mr. George H. Thompson, one of the vice-presidents of the Union Bank of Canada, has been elected a director of the Bell Telephone Company. On the board of directors he succeeds the late Mr. C. F. Sise. Mr. Thompson has lived all his life in Quebec City and was at one time president of the Quebec Railway, Light, Heat and Power Company.

Mr. George Wright has been appointed by the Hydro-Electric Power Commission to succeed Mr. R. G. Black, resigned. Mr. Wright was born in Glasgow and early in life joined the British Navy. Later he was connected with the Canadian Pacific Railway Company and is now the head of the firm of George Wright & Company, proprietor of the Walker and Carls-Rite Hotels, Toronto.

Mr. George Garret, for sixteen years master mechanic and superintendent of rolling stock on the staff of the Winnipeg Electric Railway Co., has resigned his position and will take a well earned rest before taking up similiar duties elsewhere. Mr. Garret has been succeeded by W. H. McAlloney of Halifax, N.S., who for some years was superintendent of rolling stock for the Denver Tramways.

Mr. F. F. Espenschied has resigned as assistant engineer of the Hydro-electric Power Commission of Ontario to become connected with the Combustion Engineering Corporation of New York City. Mr. Espenschied is a graduate of Cornell University, 1905, and before coming to Canada was general manager of the Interstate Light and Power Company, Galena, Ill., and previous to that with the West Penn Power Company at Connellsville and Pittsburgh, Pa.

Lieut. C. E. Knox was among those included in a list of officers, mentioned in dispatches by Sir Douglas Haig for conspicuous work in France. Lieut. Knox is a son of R. R. Knox, traffic superintendent of the Winnipeg Electric Railway Co. He has been in France for the past two years having left with the 101st battalion. His entire platoon was made up of conductors and motormen. Lieut. Knox was in the employ of the company, before going overseas, as chief clerk to his father.

Mr. J. E. Brown, general manager of the Ottawa Hydro-electric Commission, has been elected a member of the Engineering Institute of Canada. Mr. Brown, who commenced his electrical career with the Royal Electric Co., Montreal, has been connected with the Standard Electric Co., Ottawa, Deschenes Electric Co., P.Q., Hull Electric Co., Ottawa, and Hull Power Co., Consumers' Electric Co., Ottawa, and since 1905 has been with the Ottawa Hydro-electric Commission, of which he was appointed general manager in 1912.

Mr. J. S. Gillies, of Gillies Bros., Ltd., lumber merchants, Braeside, and Mr. Harry A. Sifton, Ottawa, son of Sir Clifford Sifton, have joined the Board of the Southern Canada Power Co., while Mr. C. J. McCauig has retired. The Board is now constituted as under: Messrs. W. C. Hawkins, president; F. W. Teele, vice-president; Jas. B. Woodyatt, general manager; L. C. Haskell, secretary-treasurer; W. K. Baldwin, H. T. Chalifoux, James Davidson, W. H. Miner, Lt.-Col. J. R. Moodie, A. J. Nesbitt, Geo. Parent, K. C., Chas. E. Read, J. M. Robertson, C. W. Tooke, J. S. Gillies, and Harry A. Sifton.

Obituary

Mr. Charles Cassils, vice-president of the Bell Telephone Co., and director of the Northern Electric Co., died in Montreal, on July 2nd, aged 77. Mr. Cassils, who was a Scotchman by birth, was also a director of several other companies. He was identified with the iron and steel business, representing British and American companies.

Speaking at a recent gathering of telephone employees, Mr. Cassils related how he came to this country on the same vessel as Alexander Graham Bell. Mr. Bell was accompanied by his father and mother, the latter of whom was very deaf. Mr. Cassils recalled the fact that when Mr. Bell played the piano Mrs. Bell used a very large ear trumpet, which was placed right into the piano. Mrs. Bell's deafness was one of the reasons which led Mr. Bell to study the subject of sound, and which resulted in the invention of the telephone.

Wilford Phillips, for seventeen years general manager of the Winnipeg Electric Railway Company, passed away at Rochester, Minn., on June 12th, following a prolonged illness and an operation. Mr. Phillips retired from his post as general manager of the company on October 1st, 1917, as a result of ill health, and from that time until his death had been under the doctor's care. His remains were interred at Toronto.

The late Wilford Phillips was born on Oct. 8th in Prince Edward County, Ontario. He remained on the farm until he was 28 years of age, during which time he gathered a knowledge of engineering, and in March, 1890, accepted a position with the Metropolitan Street Railway, Toronto, the first railway to successfully operate an under-running trolley road in Canada. He remained there until July, 1892, when he accepted the position of engineer and superintendent of the North Toronto Waterworks and Electric Light Co. In March, 1893, he became engineer of the Niagara Falls Park and River Railway and in 1896 was appointed manager of the same company. In June, 1900, he resigned, and in August, 1900, accepted the managership of the Winnipeg Electric Railway Co. He was married in June, 1881, to Susan Dorland of Prince Edward County. His wife and one son survive him.

Electric Light for Matheson.

The ratepayers of Matheson, Ont., decided on Friday, June 28th, to accept the scheme for an electric lighting and pumping plant which had been submitted by J. Everard Myers, electrical contracting engineer, of Toronto and Haileybury. The plant will consist of oil engine, 550 volt generator, exciter, main switch board, transformers, 40 street lamps and overhead feeders 1½ miles from town for driving pump, consumers lighting, etc. The plant will cost about $10,000. The council are arranging for the poles and erection of same. All other work will be carried out by J. Everard Myers. The lighting will be ready for use by October.

Plans for enacting legislation in the United States authorizing government control of telegraph, telephone, cable and radio systems, are under way.

The Dealer and Contractor

How a Small Merchandising Business was Turned into a Huge Success by Applying a Few Practical Ideas

There is an old saying that "nothing succeeds like success," and yet it is probably nearer the truth that the same policy that produced the original success is the cause of its continuance. If a man is successful in business it is generally because his methods are right and, vice versa, if his merchandising methods are good, business success is almost inevitable. This is as true of the electrical contractor-dealer as in any other kind of business.

An interesting story of merchandising success was recently told before the Wisconsin contractor-dealers by Mr. Acker, of Sheboygan, and is reported in Electrical Merchandising, as follows:

In our old building we were doing a merchandising business that ran from $50 to $75 per month, but the basement location did not seem to be suited for retail trade so we decided to move. We bought a building. The building we purchased did not prove to be entirely suitable for our purpose, however. It was a two-storey affair about 18 ft. wide and was so arranged that it was necessary to put the fixture stock on the second floor. We found it was difficult to get people to go upstairs to look at these things, so after a very short stay here we decided on making another change.

We were very fortunate in being able to lease at a favorable figure a building in the very heart of the retail district of the city. At the same time we found it possible also to rent the building we had purchased, at a figure high enough to pay our rent in the retail section. We had the owner of the leased building put on a good front for us, and moved uptown.

We fitted up a rest room in the front of the building with rugs, rocking chairs, a telephone from which free service was furnished, and other accommodations, which pleased the feminine trade.

Then we began to work all sorts of schemes and ideas to get the women to come into our place of business. We let it be known that this front vestibule was open to the women for all sorts of public work. They have conducted Red Cross and Liberty Loan campaigns from this headquarters regularly until it has become one of the downtown social centres.

Since we recognize that a great deal of our trade does come from the women, we make an extra effort to keep the store clean. It is scrubbed and swept with precise regularity. Moreover, we have gone in rather strong for 'Warner' cases so that a woman does not have to know the name of a piece of electrical goods in order to buy it. She can walk up to one of these cases and say 'I want one of those,' pointing out the article to which she is referring, and can get it without any lengthy conversation with the clerk.

We make it a point to carry a good line of the expensive hollow ware. Some of this runs from $50 to $75 a set, but it gives the store tone, and we manage to turn over enough of it to make it pay to carry the line. Our women customers help us very materially in this.

The fixture business is now carried on on the ground floor. Three booths have been constructed for this business. In connection with the fixture trade we have done something which I believe is extraordinary, in that we have built up a considerable business in dresser brackets. We have put fixtures of this sort on some of the best furniture in town, and we consider it extraordinarily good business because the installation of fixture brackets always makes for additional outlets on any wiring job.

I have known of instances wherein twenty-five to thirty additional outlets have been placed in a single house owing to the necessity for providing current taps for these dresser brackets. Sometimes as many as five outlets will be placed in a single bedroom to make it convenient to hook up the dresser in several of the locations which it may occupy at different seasons.

In connection with the dresser bracket idea it is always possible for us to talk heating pads which also furnishes the store with profitable business. It is our policy, in talking about these dresser brackets, to quote the price for the bracket installed with the outlets in a lump sum. The prices for the installation of these brackets run from $3.50 to $8 apiece. The value of carrying out the fixture business along these lines may be judged from the fact that our fixture business has increased about 500 per cent since we have moved into the new store.

In fact, by improving the looks of his store both as to exterior and interior appearance, the contractor-dealer puts himself in a position where he cannot avoid getting increased business. Over the counter in our new store during the first year we did a business of from $150 to $200 a month. At present our cash sales will run from $500 to $700 a month. The sales which are made on charge accounts will add approximately 50 per cent to this figure.

It is my opinion that a store which will do a real merchandising business along these lines need not fear competition from its local central station. Last fall we made a record of our sales and reduced this record to wattage so that we could show the record to the officials of our light and power company. At this time they were thinking about starting a merchandising department. When they discovered what a thorough job of loading their lines we were doing through our merchandising activities, they stated that our store was of as much value to their company as any merchandising department operated by other properties in the same sydicate. They of course decided to let well enough alone and have not gone into the merchandising business in Sheyboygan.

The problem of jobber competition likewise will take care of itself if merchandising is handled on a businesslike basis. When the jobber sends the contractor-dealer a letter stating that a certain firm in his town has asked for prices on an electrical product, the contractor-dealer should go out and get the business and answer the jobber's letter.

Too many contractor-dealers take the stand that the

man will have to come into the store and buy the material anyway, so it is no use to follow up the jobber's inquiry closely. This sort of inactivity leads to calls by the jobbers' salesmen upon the prospective customer, and of course leads to loss of business.

A bigger problem than handling central station or jobber competition is the problem of handling store help. I thoroughly believe that the contractor dealer should delegate to his store help, full authority to run the store. It is a very good thing for him to be around and to do missionary work, and to handle cases where customers demand to see the owner of the store. Nevertheless, the force should be sufficiently well trained and sufficiently competent to handle any problems that come up. At my store the force consists of a girl, a bookkeeper and one additional man, all of whom are capable of quoting on small wiring jobs.

"To sum up, it seems to me that the cardinal points in bringing to the store of the contractor-dealer a bigger volume of merchandising business are: (1) To conduct a consistently clean place of business; (2) To work all sorts of plans to get the women to come into the store; and (3) To use every means possible to impress upon the customers the fact that they get courtesy, even down to the point of being waited on in their proper turn."

How to Increase the Sale of Electrical Appliances —Everything Depends on Co-operation of Manufacturer, Wholesaler, Contractor and Dealer

Plans for the success of any electrical merchandising campaign cannot be carried through unless complete unanimity prevails among the various interests. Neither can such plans be carried out by a few. There must be team work and everybody must be in it. This is the text of an address by Mr. J. G. Spurr, recently delivered before the New Jersey Association of Electrical Contractors and Dealers, when he spoke of plans to increase the turnover of every man in the state connected in any way with the electrical business.

One object of the plan is to vastly increase installations for electric service, to make these installations better, to increase the sale of current consuming devices, which will, of course, be followed by an increase in the consumption of current. Fundamentally, we must recognize that our business possibilities increase directly with the increase of installations for electric service. Therefore, it is the avowed intention to vigorously go about the increasing of these installations so as to increase the electrical business opportunities as to the sale of appliances, supplies and labor.

The first movement will be the education of the general public to the valuable service that can be had by the use of electric service in connection with light, heat, cooking and power. We will then take up the education of the architects and owners of buildings to be more complete in their plans.

For every new circuit installed will make added business immediately for some one, and open a field for the future, that would be restricted by just that much were the circuit not available.

Organization.

The work that is being done is the organizing of the different branches of the industry. One organization, that of the manufacturers, one that of the jobbers, and one that of the contractors and dealers. Each one of these separate organizations to carefully consider their interest in the matter, to thrash out the objects they wish to attain. To have these objects so broad that they can be subscribed to by the vast majority of all concerned, and then to bring these organizations together to be molded into a single group representative of the whole, with a declaration of principles, and a code of ethics that will insure success for future efforts.

Jobbers' Organization.

We are organizing all the electrical jobbers, both large and small, who are located in the State, into one general organization, which will meet each week for the purpose of discussing ways and means for the increase of sales of electrical merchandise, and to appoint such committees as are necessary to co-operate with the electrical contractor and dealer, and with the lighting companies for the purpose of assisting them in educating the architects, increasing the demand for quality goods, and insuring the maximum outlets being provided for in all new buildings, and co-operating with them in all ways that will tend to increase electrical current consumption.

Contractors' and Dealers' Organization.

In the organization of the contractors and dealers it is intended to include all individuals, firms, and corporations that engage in the business of electrical contracting and the retail dealers in current-consuming appliances. This organization, through committees, to work in harmony with other organizations connected with this movement to do their part to attain the common goal.

Manufacturers' Organization.

The organization of the manufacturers will wait on the successful organization of the jobbers and the contractors and dealers. When this is done the manufacturers will undoubtedly organize on similar lines.

A movement of this kind must necessarily be in the hands of those who have gone into the details of the operation and know the possible results. Certainly, no man in business can be hurt by what it is intended to do, and it is just as certain in my opinion that if carried to a successful conclusion the individual interest of every man in the business will be served in a most substantial way and increase in gross and net profits must result.

I would like to have you consider the Goodwin plan under which we are operating.

1. The Goodwin Plan—

A plan of organization strong enough to undertake the solution of all problems affecting the four branches of the industry and to provide a code of principles or ethics by means of which all interests can work harmoniously, each paying due respect to the functions performed by the other without discrimination to any branch or to the public in general.

2. Joint Action is Necessary—

Without joint action, i.e., all four branches of the industry working in harmony, it is impossible to reorganize an industry, much less the electrical. Contractor-dealers, jobbers, manufacturers and central stations, must have their associations, and these associations working through their joint committees can eliminate many of the ills of the industry.

3. Let Us Face Facts—

The old basis of competition was price. The new basis is service. Your business cannot stand still for any length of time—it must either advance or go backward. A successful business requires time, money and knowledge, which is true of the electrical and all industries.

4. Stand by Your Leaders—

(a) As industrial and commercial enterprises expand, the demand for able leadership becomes more and more insistent.

(b) No plan, no matter how well designed or how carefully installed, can be effective unless all who are concerned in its operation co-operate to the full extent of their ability

and stand by their leaders, irrespective of the fact that they may be wrong temporarily.

5. The Closed-Door Policy—

Nothing can be gained by keeping allied interest in ignorance of your operations. Associations are built on the principle of the co-operation of all, not on the will of a few. Nothing is more destructive than suspicion of action or intentions.

6. Statistics will show Contractors Importance—

The electrical contractor is the largest single factor in the purchase of electrical material, but because he is poorly organized has less to say about its distribution than any of the other branches of the industry.

7. A Good Sale is a Good Buy—

(a) It is recognized to-day to be both poor ethics and bad business to stock a dealer with anything that he cannot sell to advantage.

(b) A sale is not a coldly scientific process; it is a friendly red-blooded man-to-man transaction.

9. Develop Non-Competitive Business—

(a) Many who would never take a five cent piece belonging to another appear to have no conscientious scruples about cutting when he knows the price of the other man.

(b) In the best sense true profits are the rewards of a real service, of foresight and judgment, which often requires courage, good sense and great ability.

(c) The business cemetery is full of contractors and jobbers who have tried to sell their service too cheap.

10. Help Your Jobber and Let Him Help You—

(a) Partly because of the general ignorance of the jobber's service, a suspicion has arisen that his service is uneconomical and not worth the money to be paid for it.

(b) The middleman is influential in helping to establish relatively uniform prices over comparatively large areas.

(c) The services rendered by the jobbers is that of a specialist in distribution.

(d) Prices must never get so low as to eliminate margins of all who serve.

(e) Goods are made for the consumer, not the jobber or dealer, and so every step in distribution must be planned for the needs of the consumer.

In closing, gentlemen, I wish to say that the next step forward in the organization of our industry will be along the lines of finding and adopting the true standard conditions under which we shall all labor.

National Contractors' Convention, July 15-20

The 18th annual convention of the National Association of Electrical Contractors and Dealers will be held in Cleveland July 15-20 inclusive. An attractive programme has been prepared, including the following papers: Scientific System of Wage Adjustment, by L. K. Comstock; Organization, by James R. Strong; The Goodwin Plan, by W. L. Goodwin; How to Open a Retail Store, by G. M. Sanborn; How an Electrical Contractor Can Become a Successful Retailer; The Application of Electricity as Applied to Industrial Plants; and so on. Doubtless the greatest interest centres around a discussion of the famous Goodwin plan, which its originator designed to bring into closer touch the contractor, the manufacturer, and the wholesaler. There is plenty of evidence that this plan is working well, but it is also evident that all the ills of the electrical industry have not been removed as completely or as quickly as it was anticipated they might be, by a closer cooperation of the various elements of the trade, when this plan was originally suggested. There seems to be a tendency to take it for granted that this plan will work itself out, when, as a matter of fact, it will be necessary that the various contractors' associations be constantly on the alert that their enthusiasm and the enthusiasm of the manufacturers and wholesalers does not wane.

As announced in last issue, a number of members of the Toronto Electrical Contractors' Association will attend this convention. A registration fee of $5.00 will be charged to help defray convention expenses. The convention is open to any one who is sufficiently interested to attend and listen to or take part in the discussions.

"Pegging Away"—Do You Happen to Know Jim?

The loafers gather on the steps of Jones' Electric Store; there's dust on Jonesey's counter; there's junk on Jonesey's floor. There's a snag in Jonesey's system—that's as plain as A B C; not a thing that's ever wanted is where it ought to be. Jim never cleans his windows—says it makes the light too strong; he never straightens out his stock—it takes too cussed long. Jim Jones abhors "fine fixin's," says he doesn't think they pay. "I'll git along," says Jim, "as long as I kin peg away." So Jim he pegs away at this and pegs away at that, sells Mrs. Binks an iron, or wires up a flat, takes an order for a washer, or sells an eight-inch fan. He pegs away at keeping store and does the best he can, but with all of Jim's persistence he doesn't get ahead—says business needs assistance, that the dad blamed town is dead. So he tinkers in his workshop, says he "hopes to make 'er pay," and "By Heck, I don't see why she won't—I always peg away." Jim could take a hundred hunches from the grocer up the street, who sells green stuff tied in bunches, who is bugs on being neat, who never mixes spuds and greens, or cabbages and peas, who keeps his records perfect, and collects his bills with ease, who knows the cash that each day brings, the profit on each sale, knows how to watch the little things and gather in the kale. That's why this man of corn and beans can joyride in his bus, while Jim, who ought to have the means, must peg away and cuss.—Contact.

New South Philadelphia Works of the Westinghouse Electric and Manufacturing Company

Spurred on by the urgent need of the government for ships, the Westinghouse Electric and Manufacturing Company has made a record in the erection and operation of its South Philadelphia Works, now devoted entirely to the production of ship propulsion machinery for the Navy and the merchant fleet. A little over a year ago, the present site was plowed field; now it contains seven large buildings which gives employment to 2,500 people. These buildings, comprising a floor space of over 600,000 square feet, include a pattern storage shop, foundry, forge shop, power house, erecting shop, and two machine shops. It is expected that eventually, this plant will be of a size comparable with the East Pittsburgh Works, which now employ in the neighborhood of 25,000 people, and cover a floor space of over 100 acres. A portion of the land will be devoted to a townsite capable of accommodating about 5,000 people.

A number of tool manufacturers are devoting a considerable portion of their facilities to the manufacture of tools needed by the United States Government to help win the war. Prominent among them is the Smith & Hemenway Co., Inc., whose plant at Irvington, N.J., is very largely given over to the making of tools for Uncle Sam. The "Red Devil" tools have proven so satisfactory to the Government that Smith & Hemenway Co., Inc., have been obliged to put up a new building, which is now being completed. New machinery of the latest design is being installed, and the result will be an increased output and a saving of time in producing it. Late last year the factory in Hill, N.H., added a new building, which has increased the facilities for producing "Red Devil" glass cutters at that factory.

What is New in Electrical Equipment

Motor-Driven Machines in Cork Factory.

Progressive manufacturers of bottle-corks find that production is multiplied and costs reduced by the installation of electrically-driven automatic machines. A glance through one of these modernized cork works is quite interesting. The raw cork is imported from Portugal and arrives at the factory in flat blocks from ½ to 2½ inches thick. The first operation is to cut these blocks into strips the width of which is determined by the length of the corks to be made. For this process circular saws are used, each being driven by a Westinghouse alternating-current motor running at a speed of 1725 revolutions per minute. As the strips are sawed they drop into large baskets, and are then taken to the punching machines.

In the older factories the punching machines were arranged in groups and driven from a line shaft. The punching was done by a rapidly revolving cylindrical knife which could be moved sidewise by operating a pedal. Thus the operator fed in the strips of cork and punched out each cork by pressing the pedal. In our improved factory we find these machines each driven by its own ¾ horsepower Westinghouse motor and operating two punches instead of one. No special skill is required of the operator who simply feeds in two strips of cork, all other operations being performed by the machines and the finished cylinders dropping into barrels behind the machines.

Many of these straight cylindrical corks are used in this form, but for most purposes they must be tapered. The

Cutting cork into strips—Four circular saws each driven by a one horsepower Westinghouse single-phase motor.

tapering machine is entirely automatic. The cork cylinders are thrown into a large hopper which narrows at the bottom to a pipe, through which the corks pass in single file. At the end of this pipe a mechanism seizes each cork and holds it against a disc-shaped knife revolving on a horizontal plane. This knife removes a thin shaving which is carried away by the exhaust system, while the finished cork drops into a basket. This machine can be adjusted so that any desired degree of taper can be obtained. Ten of these tapering machines, a knife-grinder, and a blower are driven as a group by a Westinghouse squirrel-cage induction motor of five horse-power capacity.

After being tapered, the corks are sorted by hand, no machine having as yet been designed which will successfully perform this work. In the highest grade, the corks are

Punching cork cylinders from strips—Five automatic Duplex cork machines, each driven by Westinghouse alternating-current motor.

smooth and almost free from imperfections, while in the lowest grade they are coarse and full of small holes and woody ducts. Between these extremes are various grades according to the degree of perfection and the uses to which they are to be put. The last process is cleaning and polishing the corks, which is done in a tumbling barrel, after which they are ready for market.

Siemens Now Entirely British

The firm of Siemens Bros. & Co., Ltd., London, Eng., with an office in Montreal, is now entirely British, the German interests having been eliminated. The Siemens Bros. Dynamo Works Ltd. has been taken over by Siemens Bros. & Co. It was stated at the annual meeting in London that the business in 1917 was a third larger than that of the previous year, and that the expansion was principally in insulated wire and cables, ebonite and batteries. Considerable work had also been done in installing automatic telephone exchanges.

Since the entry of the new directors into office negotiations had been inaugurated with other companies doing similar industrial business with the object of bringing such manufacturers together for the reduction of unnecessary competition and the avoidance of duplicating machinery workshops, and offices. Co-operation would make for the more continuous running of plants, with the attendant advantages of cheaper production, increased efficiency, and improved quality of the work done, avoiding unnecessary expense in storage, selling organizations, and reducing the duplication of stocks to a minimum. An even more important advantage aimed at was the amalgamation of designing offices, and interchange of experience, designs, and methods to the promotion of economy and efficiency. Such industrial alliance would, moreover, make it possible to carry out complete installations within the allied group. An alliance of this nature had already been arranged with Messrs. Dick, Kerr and Co. Ltd., in the field of dynamo installations in all its ramifications and other alliances were contemplated.

A Compression Chamber Arrester for 10,000 and 13,200 Volt Circuits.

To protect pole type transformers on 10,000 and 13,200 volt distributing lines, the Canadian General Electric Company has placed on the market a unique form of compressor chamber, multigap lightning arrester in which is embodied the shunt resistance principle, Fig. 1. Gaps of a simple, though rather unusual design, are connected in shunt with and mounted on, the resistance rods from which they are suitably insulated. The arrangement of the gaps and resistances is shown in Figs. 2, 3 and 4. Protection from the weather is obtained by enclosing the gaps and resistances in a porcelain tube. By reason of this combination of gaps and resistances the arrester will discharge at low rises in potential, is sensitive to lightning over a wide range of frequency, and following the lightning discharge, quickly cuts off the generator current and prevents "grounds" or "shorts."

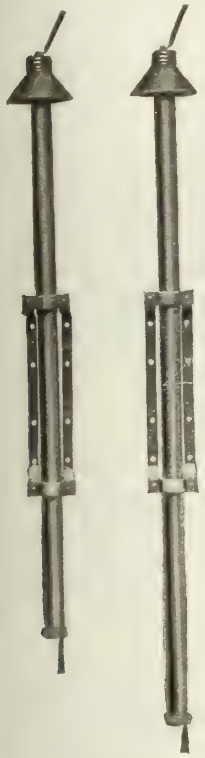

Fig. 1

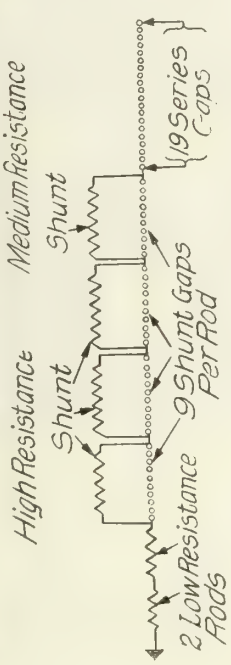

Fig. 2

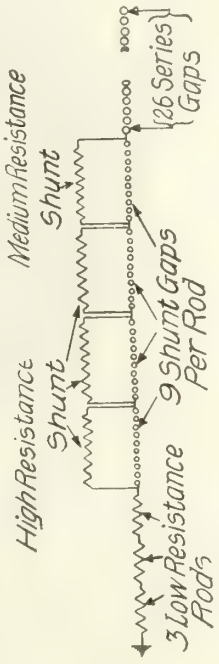

Fig. 3

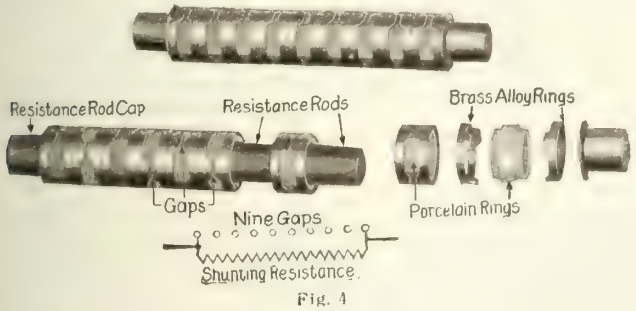
Several paths for the lightning discharge through the arrester are offered by the four units of shunting resistance



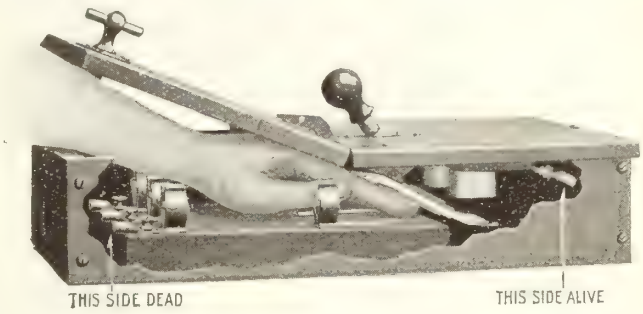


Fig. 4

used. As the resistance rod in contact with the series gaps is grounded through the other resistances the initial discharge is made easy, because the ground potential is brought up to the bottom of the series gaps. The path which the discharge takes after passing through the series gaps depends on the frequency and quantity. Very high frequency will discharge straight across all the gaps. Discharges of lower frequency will take place through one of the shunt paths. The generator current which follows the lightning discharges will shunt to the resistance rods, being thus limited to an amount that can be extinguished readily by the series gaps. The arrester affords complete protection and is light, efficient, compact and proof against fire and weather. It is recommended for outdoor installations of small capacity transformers.

A Real Safety Switch

In many steel mills, factories, mines, and similar industries where most of the workmen have little knowledge of electricity, it is desirable to use switches having no live parts exposed or accessible in the ordinary operation of the switches or when replacing fuses. This is fully accomplished in the Krantz auto-lock switch, now marketed by the Westinghouse Company which is intended for use on main circuits or wherever an ordinary knife switch is applied. The switching parts and fuses are enclosed in a steel box, the cover of which is in two parts, one part being screwed on to form a permanent covering for that end of the box containing the switch, and the other part being hinged so as to swing back and permit the renewal of fuses, which are located in this portion of the box. An ingenious latching mechanism makes

it impossible to open the cover without first throwing the switch to the "off" position and rendering all fuses and other accessible parts dead. Thus fuses may be replaced at any time with absolute safety. As long as the door of the case is open, the switch contacts can not be closed. By using a padlock, the switch handle can be locked in the "off" position, making it impossible for any one to close the switch, except the person holding the key to the padlock. By using another padlock, the cover may be locked shut, so that the fuses cannot be tampered with. Either of these padlocks can be used independently of the other, so that the switch cover can be locked shut with the switch either "on" or "off," or the switch can be locked in the "off" position with the cover either locked or open.

Contact is made by means of a laminated spring copper brush, double ended with auxiliary arcing contacts at each end. The outer leaves of the brush are bronze to provide ad-

ditional spring pressure. The stationary contacts are of hand-drawn copper and are mounted on slate bases, one of which in the fused switch carries one of the fuse clips while the other forms the terminal block for the incoming line and is mounted under the stationary portion of the cover. The operating mechanism is galvanized steel of the toggle type, and is attached to the under side of the stationary end of the cover. This mechanism can be easily removed for inspection

[illegible] several screws. In closing, the pressure between the contacts causes the laminations of the brush to spread apart, giving it a wiping or self-cleaning action. The so-called brushes provide a double break, dividing the [illegible] between the two ends, each of which is provided with a separate arcing tip. In the closed position the switch is held in positive contact by throwing a toggle over centre. A spring provides a quick-break for opening, the mechanism being independent of the operating handle. These switches are supplied for 250, 500 and 600 volt, for either alternating or direct current service, and in capacities up to 2,000 amperes. The safety features of this switch have been recognized by the American Museum of Safety which has awarded it a gold medal and special mention.

Armored Corner Insulators for Feeder Cables

A new Pittsburgh-type corner insulator, for securely holding feeder cables on curves, is being marketed by the Westinghouse company. It is provided with a special collar or rotating ring for use where the curve is slight and the cable likely to slip off an ordinary insulator. This collar has an extended lip which curves up around the cable and keeps it in the groove regardless of the angle at which the cable turns. This eliminates the necessity for tie wires and saves time in

erection. This collar is free to move on the insulator cap, so that after the insulator is screwed to the pin, the collar may be turned until the cable seat is in the proper position best to support the cable. For sharp curves, the insulator can be used without this collar, as the deep side groove holds the cable firmly in position. These insulators are made of moulded insulation surrounded by a sherardized malleable iron cap. They are made with a one-inch pin hole and are furnished in two sizes for feeders of 500,000 and 1,000,000 circular mils respectively.

Important New Motor Book.

Lair & Lee, Inc., Chicago, announce that they have now in press the 1918-1919 edition of "The Modern Motor Car," by Harold P. Manly. It will be issued in one compact volume of 536 pages, large 12mo, with 225 illustrations from detail drawings and photographs, and a 24-page alphabetical index, durably bound in flexible keratol, with round corners and colored edges. The revisions and additions bring this standard work up to the very minute, making it a complete, practical and handy reference cyclopedia on all matters connected with the care, repair and upkeep of every type of automobile, old and new. Price $2.00, postpaid.

Mr. Calhoun Gets Promotion.

The appointment of Mr. L. D. Calhoun as assistant sales manager, has been announced by the Square D Company, Detroit, manufacturers of electrical safety switches. Mr. Calhoun has been advertising manager of the Square D Company for the past year, and in addition to his new duties, will continue to handle the company's advertising.

The Dominion Bridge Company has received an order from the Imperial Tobacco Company, Montreal, for a 400 k.w. turbo-alternator.

Banfield Show Rooms on King West, Toronto

W. H. Banfield & Sons, Limited, have taken over the buildings at 80 King Street West, Toronto, where they have opened up new and up-to-date showrooms and sales office, taking in the whole three floors. This company will now have all facilities for taking care of their city and out-of-town customers. They will show a full line of fixtures and fixture parts, fittings and accessories; also a full line of glassware and portable lamps.

Two More Bucyrus Shovels for Hydro

The Ontario Hydro-electric Commission has just acquired through the Canadian Equipment Co., Ltd., Montreal, two additional Bucyrus electrically operated shovels, making a total of eight shovels sold to the Commission. These shovels are used in connection with the new 300,000 h.p. plant of the Commission, the work on which is now being proceeded with.

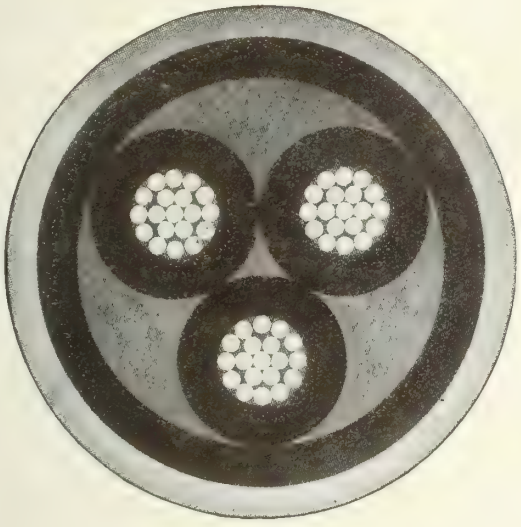
H. W. Gillett, chemist of the Bureau of Mines, Washington, D.C., after five years' experimentation, carried on in co-operation with the laboratory of Cornell University and the American Institute of Metals, has announced a perfected electric melting furnace which, it is stated, will revolutionize the making of brass.

The aldermen and commissioners of Montreal have decided to appeal to the Public Utilities Commission against the increase in the fares of the Tramways company recently granted by the Tramways Commission. There has been a certain amount of opposition on the part of the public to the increases, the proposal to impose a cent for a transfer being objected to in particular.

Trade Publications

The Crouse-Hinds Company of Canada have issued a colored folder emphasizing the care with which their products are packed, catalogued and shipped.

Boiler Feed Pumps—Pamphlet issued by the De Laval Steam Turbine Co., Trenton, N.J., entitled "Centrifugal Boiler Feed Pumps," describing the De Laval combined steam turbine and centrifugal boiler feed pump.



A handsome catalogue is being distributed by the Jefferson Glass Company, Limited, Toronto, describing and illustrating their color decorations, etchings, cuttings and other finishes on illuminating glassware. This is known as catalogue No. 6, and will be mailed on request. The catalogue contains 70 pages of very attractive and interesting matter.

L'Air Liquide Society are distributing copies of their new catalogue, which has just been issued. In the preparation of this catalogue the company have departed somewhat from the usual method of preparing such publicity matter and have given a comprehensive, though necessarily somewhat curtailed, outline of the oxy-acetylene process of welding and cutting in its many useful and indispensable applications. It also mentions the chief characteristics of the apparatus. The company announce that a copy of this catalogue will be sent on request to anyone interested in the oxy-acetylene process.

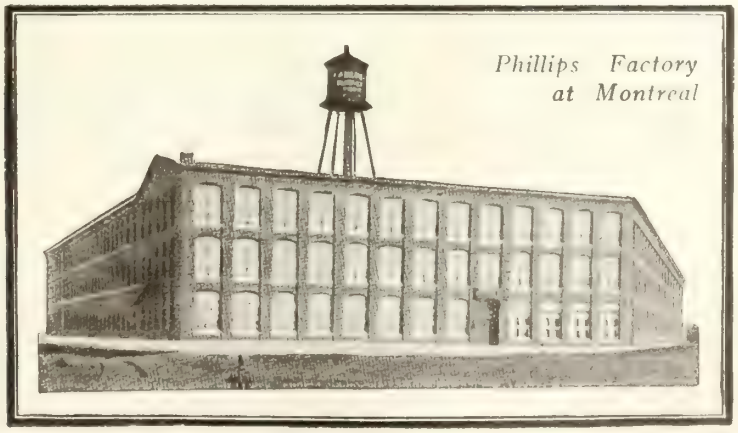
C.G.E. Publications—Bulletin No. 46018-A, describing portable instruments, type P-8; also descriptive folders covering the following: CR 3105 drum-type controllers; CR 2940 push-button stations; CR 2820-784 overload relay for use with magnetic control panels on a.c. or d.c. circuits; CR. 2820-723 current-limit relay; CR 3100 drum type controllers; Catalogue No. 618, twelve pages illustrating and describing C. G. E. pipe fittings; Catalogue No. 257, twenty-two pages, illustrating and describing Regent bowls, globes and reflectors for commercial and ornamental illumination.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

Current News and Notes

Cornwall, Ont.

Work on the new transformer station a short distance west of Cornwall, Ont., by the Hydro-electric Power Commission of Ontario, is progressing favorably. The foundation is ready for the concrete which will be poured shortly. Brockville and Prescott will be supplied with current from this station when completed.

Fredericton, N.B.

The Maritime Electric Company, Fredericton, N.B., have been granted a Dominion charter with hydro-electric powers and an early development is anticipated. Several sites are under consideration. In the meantime sufficient new equipment is to be purchased to allow the company to generate current sufficient for all present requirements.

Gladstone, Man.

A by-law providing for the sum of $15,000 to be spent on an electric lighting system, has been passed by the ratepayers of Gladstone, Man. The Echo Flour Mills Company of Gladstone will generate the necessary current.

Kirkland Lake, Ont.

Arrangements have been completed for the installation of electrically-driven mining plant at the property of the Ontario Kirkland gold mines about two miles south of Kirkland Lake. The work of clearing a right-of-way for pole line is proceeding.

London, Ont.

The annual meeting of the Western Counties Telephone Association was held in London recently, about fifty members attending. Mr. John Perry, of St. Marys, was elected president for the coming year; Mr. James McEwing, of Drayton, first vice-president; Mr. J. R. Forbes, of Waterford, second vice-president and Dr. W. Doan, of Harrietsville, secretary-treasurer.

Moncton, N. B.

A device for telephoning from moving trains has been successfully tested on the Intercolonial Railway at Moncton, N. B. The instrument has been patented by Isidor, Abraham and Samuel Berliner, of Toronto, who have also submitted to the United States government a device for detecting submarines. It is stated that three conversations can be carried on from one train and that the voices are absolutely clear.

New Westminster, B.C.

The city light and power department of New Westminster, B.C., reports a revenue of $35,000 for the first five months of 1918, compared with $34,238 for the first five months of 1917.

Construction has started at New Westminster, B.C., on a modern steel plant. Electric furnaces will be used for the conversion of scrap.

Port Arthur, Ont.

The City Council of Port Arthur have applied to the Railway Board for permission to raise the fares on the street railway. The new schedule is as follows: Adults—Five cents cash fare or one ticket at the rate of five tickets for 25 cents. Children (5 to 12 years inclusive)—Five cents cash fare or 1 ticket at the rate of eight for 25 cents. Under five years of age, free. Good between the hours of 5.30 a.m. and 12 o'clock p.m., and double the above fares between the hours of 12 p.m. and 5.30 a.m. Workmen's tickets will be abolished and the free privileges heretofore extended to Dominion policemen will be cancelled.

St. Stephen, N.B.

Application has been made by the Calais Water and Power Company, St. Stephen, N.B., for permission to establish a new scale of rates for the town of Milton. The company purchase water power from the town of St. Stephen.

Sherbrooke, Que.

Lomis Dakin, Limited, Sherbrooke, Que., have been appointed general contractors for the construction of a distributing station in that city.

Toronto, Ont.

Employees of the Toronto Hydro-electric system, and their families and friends, to the number of about thirteen hundred, held their annual outing at Queenston Heights on July 6. Prominent figures on the judging committee were Messrs. P. W. Ellis and George Wright, of the Hydro commission, and General Manager H. H. Couzens.

Vancouver, B.C.

Employees of the British Columbia Electric Railway went on strike on July 3 for higher wages and shorter hours. Two thousand shipyard employees also struck, refusing to work with machines operated by the "non-union" current of the Western Canada Power Company. It is now stated that providing the city council of Vancouver will agree to an increase in fares the B. C. E. R. Company have agreed to meet practically all the demands made by their employees. The recommendations of the board of conciliation appointed to deal with the dispute, did not prove satisfactory to the employees.

Winnipeg, Man.

Tenders have been recived by the city of Winnipeg for a new 200 kw. generator and switchboard equipment to be installed in the power house of the General Hospital.

Boilers for Immediate Sale

Suitable for shipyards, munition works, mines, mills, elevators, electric power stations, etc.

5450 H. P. of B. & W. Stationary Boilers

with forged steel headers, and superheaters, in the following sizes:—

2—450 h.p. Boilers, 16 wide 12 high, 2 48-in. drums each, installed 1902.
3—590 h.p. Boilers, 21 wide 14 high, 3 42-in. drums each, installed 1905.
3—390 h.p. Boilers, 16 wide 12 high, 2 42-in. drums each, installed 1910.
1—580 h.p. Boiler, 24 wide 12 high, 3 42-in. drums, installed 1910.
2—515 h.p. Boilers, 21 wide 12 high, 3 42-in. drums each, installed 1910.

Eight of these eleven Boilers are now allowed 150 pounds steam, and three allowed 135 pounds. All are in operative condition.

If it is desired to add to the capacity of any modern boiler plant carrying 200 pounds pressure for supplying steam turbines, these boilers can be easily adapted to 200 pounds pressure by being fitted with new drums.

To be sold as they now stand, including grates and the usual boiler connections and fittings attached to them. Purchaser to make his own inspection, to have access to all available records in owner's possession, and to remove Boilers at his own expense.

If prompt possession of any or all of these Boilers is desired, time will be saved by purchaser sending his representative here without delay.

Correspondence desired only with parties who have immediate use for any or all of the Boilers.

Upright closed type feed water heaters, and boiler feed pumps belonging to this plant are also for sale.

WINNIPEG ELECTRIC RAILWAY COMPANY,
WINNIPEG, MANITOBA

LINCOLN MOTORS

Weld and Win

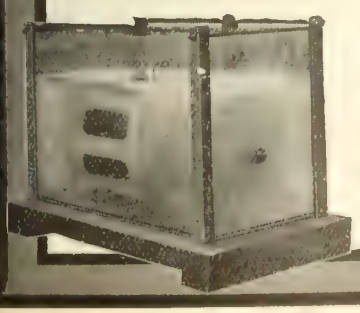
Electric Arc Welding is proving a vital factor in winning the war. Startling evidence of this is accumulating every day.

Lincoln Arc Welders

are now giving the Rock Island Lines 1400 days more engine service per year by hastening their engine repairs. They say that a full equipment of these welders will be equal to the purchase of 23 new engines. And this is only one of many roads using Lincoln equipment.

These welders are saving days of time on vital ship repairs in large eastern dry docks.

They are increasing and speeding up the output of steel castings by filling with molten steel, blowholes, shrinkage cracks and other defects that would scrap 5 to 10 per cent. of the product. Steel castings are absolutely essential in locomotives, steamships, motor trucks and most of all in the actual fighting equipment, cannon, machine guns, rifles, etc.



Get our 48 page illustrated book on welding and see what this wonderful equipment can do in the industry you are interested in. Write on your business letterhead.

Hauling Ice Electrically

[illegible] as heat and cold it we[illegible] ice after being stored and [illegible] made, must be de[illegible] at considerable cost. The Com[illegible] Industry Board, Council of National Defense, Washington, D.C., conducted an investigation in that city and found that nearly one-half of each dollar paid by consumer went for transportation.

The electric vehicle has proven to be the most economic means of city transportation. Ice dealers have carefully investigated the electric vehicle, and, as a result, they are being installed in increasingly large numbers, particularly in wholesale delivery.

A Philadelphia manufacturer has developed a special type of electric truck for meeting conditions that cannot be economically handled with the ordinary 5-ton equipment, particularly where the time for loading and unloading is relatively great, where short hauls and congested traffic is encountered, and where the conventional truck, which is designed to do considerably more work than it can possibly do on account of restricted conditions, will cost more for the work performed than horses.

The special electric truck is arranged to drive on front wheels only, the large rear wheels being steel tired; the speed is lower and the battery smaller, resulting in a materially reduced first cost, and a reduction in amortization and interest. Maintenance is also greatly reduced, resulting in a total cost lower than the cost of doing the same work with the horse equipment.—A. Jackson Marshall.

Large Transformers For Sale

3 125 K.V.A., O.I.S.C., Single Phase, 25 Cycle,
Primary Voltage 24000 12000 V.
Secondary Voltage 2400 1200/600 V.
With taps for 5%, 10%, 15% variation.
First Class Condition. Immediate Shipment.
Also—
3—T.P.S.T. 300 Amp., 25000 Volt Automatic Oil Switches.

DIRECT READING OHMMETERS

Thompson-Levering Co., Philadelphia, Pa., U.S.A.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL
The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"
Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"
Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"
Fire-resisting paint, or colorless solution.

"ARMACELL"
Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"
Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"
for coloring electric lamps. Used in the Royal Navy. Weatherproof. Dries rapidly.

"ARMABRON"
Bitumen protective paint, elastic, acid-resisting, weatherproof.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A [illegible] of the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published [illegible] 223 pages, illustrated. Price $2.40.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Ins. 332 pages, illustrated. Price $2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

Electrical Meters, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price $6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

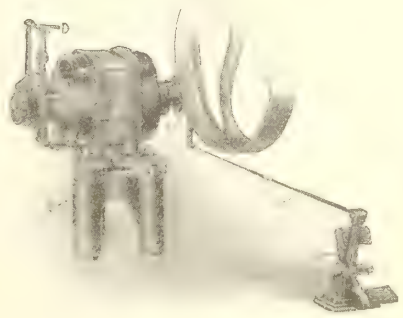
REDMANOL

"The material of a thousand uses"

THE ANHYDROUS PHENOL RESIN COMPOUNDS



They excel in
Heat Resistance—Dielectric Strength—Mechanical Strength—Accuracy of Dimensions
furnished in
sheets, tubes, rods, granular, molding plastic, impregnating liquids.

Write us for our catalog.

Redmanol Chemical Products Co.

676 West 22nd Street, CHICAGO

Kimble Motors

"A Touch of the Toe to go Fast or Slow."

That is why printers insist on Kimble Motors—and why **your** customer will buy them.

Kimble Single Phase Variable Speed Motors are made for all standard voltages and frequencies. Wherever wide speed variation and smooth running is desirable they will fill the bill.

Distributors

The Masco Company, Ltd.

91-93 Queen St. E. **TORONTO**

DIRECT CURRENT

1—360 Amp., 6 volt, D.C. plating generator, complete.
1—300 KW., 600 volt, 160 R.P.M. Westinghouse Rly. Generator complete.
1—500 KW., 550 volt, Type M, 320 R.P.M. Westinghouse Generator.
1—150 KW., 550 volt, Type M, 575 R.P.M. Westinghouse Generator.
1—450 KW., 250 volt, Type M, 320 R.P.M. Westinghouse Generator.

Engine Generator Sets

ALTERNATING CURRENT

1—450 KW., G.E., 2300 volt, 3 phase, 60 cycle, 100 R.P.M., direct connected to Allis cross compound Engine, complete with Wheeler condenser and feed water heaters.

1—600 KW., West. Alternator, 2300 volt, 3 phase, 60 cycle, direct connected to West. cross compound Engine.

1—700 KW. Ditto, direct connected to gas Engine.

1—Alternator, C.G.E., 60 cycle, type T.T.B., class 48-600-1501, Form E., volt 2,200, amp. 158, speed 150, direct connected to a Rice & Sargent Providence Engineering Works 18 in. x 36 in. x 32 in., horizontal cross compound condensing engine, complete with condensers; Wainright horizontal copper tube water heater; switchboard, piping and valves. Ask for further information.

DIRECT CURRENT

1—550 KW., 600 volt, A.C.B. Generator, direct connected to a Goldie & McCulloch cross compound Corliss Engine, complete.

MOTOR GENERATOR SETS

1—300 KW., G.E., 125/250 volt, 720 R.P.M., D.C. Generator, direct connected to one 450 H.P., 3 phase, 4000/2300 volt, 60 cycle, Ind. motor, complete with switchboard equipment.

1—150 G.E., 125/250 volt, 900 R.P.M., D.C. Generator, direct connected to suitable syn. motor, 2300 volt, 3 phase, 60 cycle, complete with switchboard equipment.

2—30 KW., 125 volt, West., 1140 R.P.M., D.C. Generator, direct connected to one 3 phase, 60 cycle, 220-440 Ind. motor.

ROTARY CONVERTERS

2—200 KW., 3 phase, 25 cycle, 600 volt, D.C., primary, 13200/1180 volt.

1—500 KW., 550 volt, D.C., West., 3 phase, 25 cycle, with 3 suitable S.P. Transformers, 13200 volt P. and 390 volt S.

4—500 KW., 600 volt, D.C., Rotary Converters, 3 phase, 25 cycle, with suitable transformers; 6600/5940 volt P., 430-286-143 volt S.

1—300 KW., 575 volt, D.C., 370 volt, A.C., 600 R.P.M., complete with three 185 K.V.A., 60 cycle transformers, 2200 volt P., 370 volt S.

STEAM TURBINES

2—400 KW., West., 3600 R.P.M., 160 lb. Steam, 2300 volt, 3 phase, 60 cycle, complete.

1—1500 KW., G.E., Curtis, 3 phase, 60 cycle, 2300 volt, 3600 R.P.M. Complete.

1—500 KW., Allis-Chalmers, 2200 volt, 3 phase, 60 cycle, 3600 R.P.M, complete.

1—1000 KW., Allis-Chalmers, 600 volt, 3 phase, 60 cycle, complete with condensers.

HYDRO ELECTRIC UNITS

2—Hydro Electric units, each consisting of one 1200 H.P. double bronze runner, horizontal cylindrical Leffell Turbines, complete with Governors and Draft Tubes. Direct connected to each of these units are two 437 K.V.A., 3 phase, 60 cycle, 4400 volt, 300 R.P.M., G.E. Generators. Equipment is complete with Switchboard, Oil Switches, Instrument Transformers, etc. Equipment practically new.

1—Hydro Electric unit, 1200 H.P., as above, with one 875 K.V.A., G.E. direct connected unit.

PUMPS AND COMPRESSORS

1—1,000 gal. Underwriter Fire Pump.

1—800 ft., 30 lbs., Vertical Air Compressor.

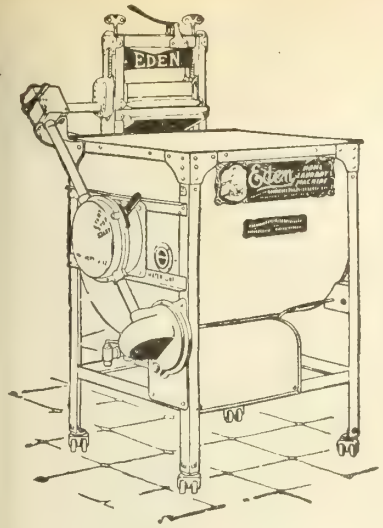
1—600 ft., 30 lbs., Horizontal Air Compressor.

1—200 H.P., Worthington, 2 stage, 12-inch Turbine Pump, rated capacity 4000 G.P.M., at 60 lbs. pressure, direct connected to one 100 H.P., 3 phase, 60 cycle, 440 volt, 575 R.P.M., Westinghouse Induction Motor, complete with auto starter and no-voltage release.

1—1160 ft. Sullivan two stage belt driven air compressor complete.

1—1586 ft. Sullivan two stage belt driven air compressor, complete.

MISCELLANEOUS



2—Light Freight Car Trucks, splendid condition.

1—10-ton, 4 wheel double block steam locomotive, construction crane.

1—50 H.P. Foss Gas Engine, speed 200 R.P.M., one cylinder; flywheel 4 ft. x 12 in. Used only three weeks.

We also handle a full line of Electric Railway Equipment and Supplies

Our stock changes daily and above list is only a small proportion of what we have. For further particulars wire, telephone, or write. Let us solve your problems. All engineering service without obligation. We advertise and sell your released equipment without cost to you.

The EDEN Electric Washer

Good Profits—Easy Sales

are assured for the dealer who handles the Eden Washing Machine. A first grade machine, that once sold, stays sold and brings new customers.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:
"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

SQUARE D

SWITCHES

Why not a Heart to Heart Talk-

THE ORIGINAL SAFETY SWITCH

with the Plant Electrician?

You know in a general way the many advantages of Square D Switches. Your own experience and observation points out the advisability of eliminating the expensive accidents which result from contact with electrical current by replacing open knife switches with Square D Switches.

But—do you know how easily this can be done—how great a saving it will effect—how inexpensively Square D Switches can be adapted to *your* plant conditions?

Your electrician does. So why not put the Square D proposition up to him? His advice will probably remove the very objections which have made you defer installing Square D Switches.

At least TALK Square D Switches to the electrician—TODAY

GROWTH—

Day after day, week after week, month after month, for the five years that Economy Fuses have been on the market, the sales have maintained a constant growth—not alone in volume, but also in percentage of increase. This is because

ECONOMY Renewable FUSES

are absolutely accurate in operation and cut annual fuse maintenance costs 80%. An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

Reaching Your Customers

THE logical place and time to talk to your customers is in the Electrical News when they are thinking of things electrical.

If your product is bought by electrical men, advertising in the Electrical News will carry your message to them.

You and your wares may be favorably and nationally known to-day but if you don't advertise you will soon be forgotten.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

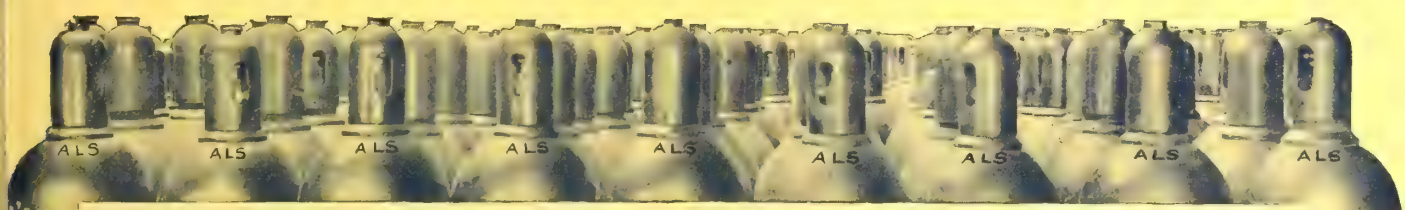
How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a **Specialist in Repairs.** Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants **quick work** and an **absolutely reliable job. You can give it to him.**

Make up your mind **now.** Say **"I'm going to get something out of the next repair job in this town."**

You have the work of taking out and re-installing the machine **(Profit).** Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the **Trade Discount (More Profit).**



Others are doing it. Why not you? Write about it.

OXY-ACETYLENE WELDING & CUTTING

A National Necessity

All these parts were reclaimed by Oxy-Acetylene Welding, and the reclamation of one part alone saved at least $150.

More important than this, however, is the fact that they were all restored to immediate service again, thereby obviating the waste of time, labor and material that would result by having to scrap them.

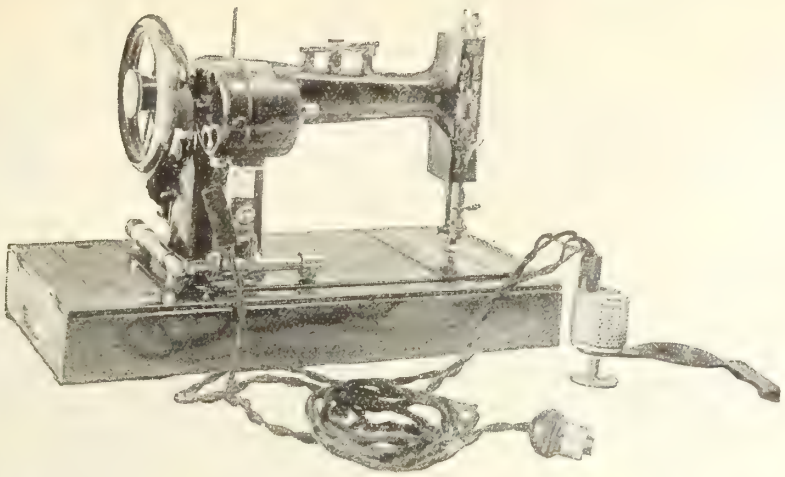
Best Known Cable Reel In Canada

THE demand for Northern Electric products and the fact that they are made by the largest manufacturers of bare and insulated wires and cables for electrical distribution is a positive assurance of quality.

They are as near perfection in both dependability and durability as experience, workmanship and superior materials, combined with the most modern machinery, can make them.



Bare copper, rubber covered and paper insulated, lead covered cables of Northern Electric manufacture—are designed by the most capable engineering skill and tested to ensure safety and efficiency to the fullest degree possible.

Our nearest House will be pleased to submit specifications and prices upon request.

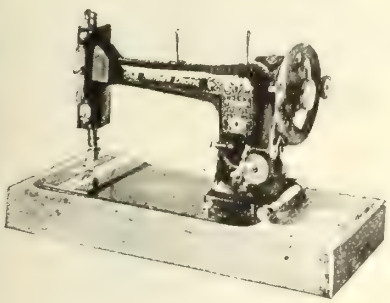
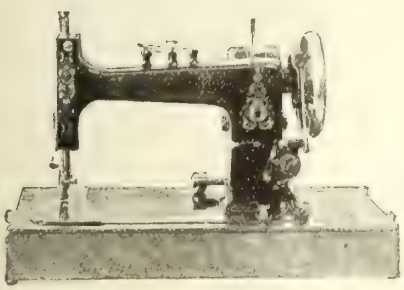
Every Woman Needs Its Help—Now



—but when the fall buying season comes, will you be ready?

Why Not Order a Good Supply of

Northern Electric



Portable Sewing Machines NOW?

Remember the greatest need for sewing by electricity is now, when the women of Canada are so extensively engaged in doing their own as well as a large amount of patriotic sewing work at home.

The Northern Electric Sewing Machine eliminates the tiresome, back-aching treadle work of the old method, and enables the operator to do twice as much sewing without effort.

The Northern Electric Sewing Machines are of the highest grade in design and workmanship, and carry a guarantee of complete satisfaction in every way.

Several different types are obtainable in both portable and stand style machines. You can secure either vibrating chuttle or bobbin type.

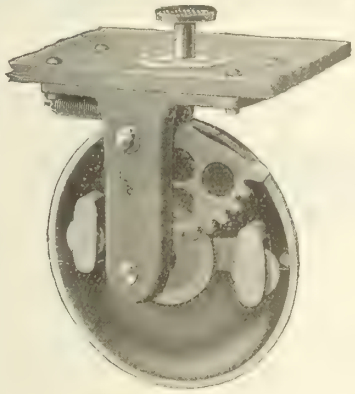
We urge you to use these famous, "better service" Keystone Car Specialties

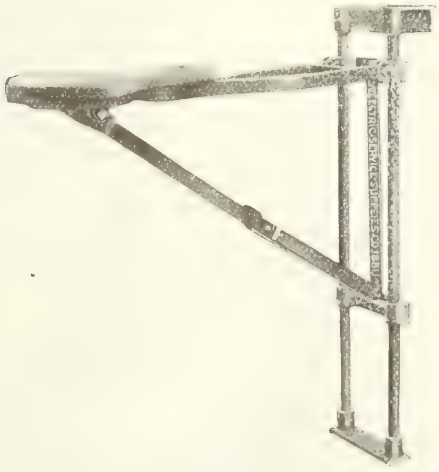


Faraday Car Signal Systems

Operates from line voltage—no batteries. Faraday Push Buttons, Buzzers and Resistances furnish an ideal, failure-proof car signal system.

Illuminated Car Signs

With these signs destination names can easily be changed and cars rerouted. Well labeled cars make more money.



Keystone Rotary Gongs

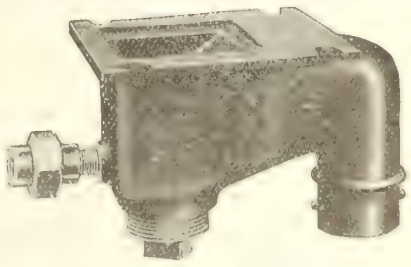
A louder gong and more continuous to meet requirements resulting from modern, heavy, noisy traffic in cities.

Safety Car Lighting Fixtures

To light up your cars scientifically, efficiently and safely. To save you money.

Keystone Motorman's Seats

For the motorman or conductor. A real collapsable, safe and durable seat. They make operations more contented.



"Golden Glow" Headlights

To light up a path of safety on your cars. Only their famous reflectors can project the distinctive "Golden Glow" light.

Keystone Trolley Catchers

To protect your overhead conductors from "flying" poles thus preventing delays and trouble.

Keystone Air Sanders and Valves

To automatically sand your tracks by compressed air. A real device for safety and accident prevention.

50 H. P. Motor Stator Coils Being Soldered with J-C Soldering Iron, in Shops of Robertson Elect. Construction Co., Buffalo.

Save Hours on your Job
with the
J.C. Electric Soldering Iron

The new J. C. Electric Soldering Iron saved 3½ hours on a 5 hour job. The fastest and most economical method of soldering.

Instead of taking 5 hours to solder the terminal leads of the stator coils of this motor the J. C. Soldering Iron cut this time to 1½ hours—a saving of 3½ hours. The secret of the efficiency of this remarkable Iron is the fact that it heats only while in contact with the work, and then heats almost instantaneously.

Installing a Trunk Line Subway

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the **Underwriters' Laboratory** under the direction of the **National Board of Fire Underwriters** and every coil carries their label.

We will be glad to send you a sample.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

THE LEEDS & NORTHRUP CO.

Electrical Measuring Instruments

4912 Stenton Ave. PHILADELPHIA, PA.

The Needs of the Empire

NEVER BEFORE in the history of Canada has greater opportunity been offered her Sons and Daughters to render SERVICE to the Empire;—and

NEVER BEFORE have the needs of the Empire demanded as high a standard of QUALITY in thought, deed and product as at present.

HOW NOBLY CANADA has responded is now known around the World and history will record it for the future.

THE PRODUCTS OF OUR MILLS are at the Fronts and on the Seas, in the Shipyards and Factories and in the Fields, faithfully fulfilling their mission of reliable performance wherever the Government's War-Winning Programme directs, as we are, and have been, stripped for action since the first call to arms.

THE NEEDS OF THE EMPIRE are many and the War-Winning Programme changes as necessity demands; but it matters not, the needs of the Empire are paramount and must be supplied.

THEREFORE, if in these trying times, we do not deliver promptly to you such of the products of our Mills or Blast Furnaces as you may need, console yourself with the thought that through us, you are rendering Service to the Empire and to the Cause that matters most for the Liberty, Justice and Freedom of the World.

WORKMANSHIP

Type I-14 Watthour Meter

The mere mention of the word "Swiss" in connection with watches recalls something delicate yet durable, accurate though minute. Those world-famed watchmakers have grown up with the trade; they are masters of their art. Each article that leaves their hands for sale, they know not where, is a living replica of their workmanship, is a vibrating proof of their skill.

A meter is in many ways a mechanism as perfect as a Swiss watch. The men who make C-G-E meters also are masters of their craft.

The jewel of the I-14 Meter is selected and minutely scrutinized for bad spots. The little sapphire must be perfect if it is to be used in C-G-E Meters. In the manufacturing of the pivot bearing, the coils, and the registering apparatus, the same care is exercised. The result is the highly favorable light in which C-G-E Meters are viewed by the discriminating men of the Electrical profession.

A Light Where You Need It

WIREMOLD

Will Conveniently Carry the Current

Opening Up a New Field of Business

For the Electrical Contractor

Everybody will want this clever, quick and safe way of making an electrical extension. There are unlimited possibilities for the use of WIREMOLD. In the home it will provide convenient connections for the electric iron, vacuum cleaner, or putting lights in favored corners. The business man will appreciate the ease with which WIREMOLD will bring the current and the light anywhere he wants it for any purpose. No stopping work to fix WIREMOLD. No dirt, fuss, nor loss of money. We are telling thousands of people every day about the advantages of easy extensions by WIREMOLD. The customers are already on the way for it. You will reap a large share of the business which is bound to result if you are ready to supply the demand.

SPECIAL TRIAL ORDER LOT

has been arranged for your first order. It contains 100 feet of WIREMOLD and a unit package of each of the 15 fittings—all that is necessary for any average job. The special lot will be forwarded to you on receipt of your cheque for $24.96.

There is big business here if you will go after it. WIREMOLD in itself will form an excellent medium for introducing your electrical goods and showing the ease by which they can be connected up by the use of a WIREMOLD extension.

We will help you with our advertising literature and announcements. Get to business now and write for a trial order of WIREMOLD.

These books and the WIREMOLD advertisements are daily spreading the fame of WIREMOLD. They are beautifully illustrated and contain hundreds of interesting ideas showing WIREMOLD in use. WRITE FOR YOUR COPIES.

Vol. 27 Toronto, August 1, 1918 No. 15

Value of Resuscitation Methods Should Be More Generally Known

A few days ago an accident occurred on the work of the Toronto Harbor Commissioners, whereby one of the employees received an electric shock which resulted fatally. There were a number of other workmen in the immediate neighborhood and resuscitation methods were promptly employed. The men claim that their efforts were just meeting with success and that there were actual signs of returning consciousness when a policeman came along and insisted that the work be stopped. The policeman telephoned for an ambulance and the injured man was taken to the hospital. The policeman later claimed that the workman was dead before he arrived.

The greatest difficulty is invariably encountered in forming a judgment as to whether a man might have died who has actually been resuscitated, or whether a man might have lived had resuscitation work been commenced earlier or carried on longer, or been followed out in a different way, but in the present case there seems to be a reasonable probability that the arrival of the policeman on the scene was the cause of this man's death. At least, it was manifestly unwise to take time to remove the injured man when a few seconds might mean all the difference between life and death. There is every possibility that the man may have been just on the point of recovering and that continuation of resuscitation work may have brought him around in due course. However, the policeman arrives—an all-powerful authority—and orders the work discontinued.

It is another example of what electrical men in particular have to contend with in connection with their resuscitation work. In spite of the fact that Ontario has now been fairly well covered by a resuscitation expert who has given actual demonstrations to practically every operating company and every municipality in the province of Ontario, the results so far do not appear to have gone beyond the electrical operating men themselves. It looks as if it would be necessary to start out on a new tack. Whatever experience this unfortunate man's fellow employees may have had in resuscitation, or whatever their knowledge of the most approved process may have been, any policeman, who lacks this information, appears to have had the power to prevent the work being carried on. Either it will be necessary, therefore, to keep such officials off the ground when an accident happens, or, which seems to be the better practice, these men will have to be trained and educated so that they may intelligently cope with the exigencies of such an accident.

The biggest difficulty lies in the uncertainty which arises out of the whole situation. It has never been possible, and never can be, to say absolutely, when a man has been resuscitated by this or that method, that he would have died without it, but there is evidence enough to convince those who have made a study of the various methods that these are of great value and that, under ordinary circumstances, there is one best method. There is also evidence to show that these methods have resulted in restoring a man after very considerable periods, and it is recommended that work should not be discontinued inside of a couple of hours unless there is unmistakable evidence that the man is dead.

We hope this particular case will be given so much publicity that it will be brought to the attention of those who are primarily responsible for the apparently unwarranted action of this policeman, so that there may be no future recurrence of such a fatal mistake.

Vancouver Operators Guilty of Indefensible Tactics

The placing in jeopardy of so essential a public service as light, power and electric transportation by the action of a body of men who acknowledge no responsibility to the public, is, we believe, a situation which should not be allowed to pass without all possible publicity. During the last few weeks, an unprecedented state of affairs has arisen in Vancouver due to the action of the operators of this company's power plants and sub-stations in wilfully attempting to close down all electrical supply as a means of enforcing their demands regarding wages and other alleged grievances. This occurred at midnight on Saturday, July 13, without notice being given to the company or the public.

The agreement between the B. C. Electric Railway Company, the Western Power Company and the B. C. Telephone Company, respectively, and the electrical workers, expired on June 30. Previous to that the men laid a new agreement before these companies, embodying many drastic changes. The two first named offered the men increases of 10 per cent., but this was refused. Accordingly a conciliation board under the Lemieux Act of Canada was proposed, but again the men refused, thereby necessitating the Dominion Government naming an arbitrator for them. The conciliation board was formed, but the electrical workers refused to recognize it.

In the meantime, an arbitration with the street railway men employed by the B. C. Electric Railway was going on, but its sessions did not close until June 28, and no time was left in which to bring down a decision before June 30. The men in both unions decided to go on strike at midnight, July 1, in contravention of the law of Canada.

It is believed that the electrical workers fully intended that Vancouver and the surrounding country should have been

without light or power on their going on strike, but the electrical superintendent and some seven or eight of his assistants, maintained the service in a score of sub-stations scattered over the mainland. No inconvenience was occasioned except by the absence of street car service, partly because the street car men were on strike and partly because the handful of men could not keep the rotaries in operation.

On Thursday morning, July 11, about 1.10 o'clock, the company came to a settlement with the two unions and agreements were signed. Service resumed the same day. It was believed that the matters at issue had been finally settled with the exception of one or two minor details, such as free transportation and a lighting rate concession which had, by consent, been left to be adjusted later.

Struck Again After Settlement

The astonishment of the whole district, the management of the company included, may be judged when a few minutes after midnight on July 14, suddenly, and without warning, all lights, power, street cars and interurban cars fed by the B. C. Electric system stopped. Thousands of persons were around at this hour. Street cars were loaded. Interurban cars were miles from their destinations. One car with 60 passengers and another with about 70 persons in it was stalled at New Westminster, unable to proceed along the Fraser Valley division. Other interurban cars were stalled on the Lulu Island and Burnaby lake lines, each with passengers in them.

The effect of the stoppage of light and power in hospitals and cold storage plants need not be emphasized. It is evident, however, that the men intended to make the tie-up complete, because not a switch was left in place in the main receiving station. The electrical superintendent arrived there within a few minutes and found a large group of linemen and operators around the station. Luckily he had an electric torch in his automobile, for without it he would hardly have been able to make his way through the station. There was not a lantern left. The sub-station had been deserted.

All that the company were able to ascertain was that the operators had received orders from someone unknown, not the load despatcher, to close down the plant. The operators at the Lake Buntzen hydro-electric plant were telephoned to and they threw off the machines there. All switches throughout the country were pulled, thus entailing a tremendous mechanical task to reinstate them.

Superintendent Newell immediately got in touch with Lake Buntzen and aroused the superintendent there, who had retired for the night. Other engineers arrived, and in forty minutes the most of the city load had been picked up, and an hour and a half later most of the railway lines were operated and cars were able to proceed to the barns. Many of them finished their own runs.

An attempt was made to arrive at the cause of the trouble, but communication with E. H. Morrison, business agent for the electrical workers, could bring no coherent account. Mr. Morrison intimated finally that they would not meet the company in any way unless the electrical superintendent was discharged. On Sunday morning, Mr. Morrison called up and asked if this had been done, and when he was told that it had not, he refused to have further communication with the company. He mentioned that other unnamed officials would have to be discharged also. It has been stated in the newspapers that the men's union have cabled to the directors of the company in London, England, demanding the dismissal of the electrical superintendent.

Employees Were in the Wrong

On Sunday, July 14, members of the board of trade and Mayor Gale formed a committee to endeavor to bring about a settlement. Street cars were again tied up, owing both to the scarcity of current and to the refusal of the men to work while the electrical workers were on strike. A joint committee was formed having on it several labor representatives and the company laid its case before them. The men demanded transportation and lighting concessions, and although the company pointed out that these had never come up, they granted them forthwith. The men alleged that 25 men had been dismissed in discriminating fashion and strike breakers kept on. Mr. W. G. Murrin, assistant general manager, showed clearly that the men who had been laid off were linemen and groundmen and were extra staff that had been working on special work which the company expected to lay off several weeks since on the completion of the work. These men were laid off strictly according to the length of their service and not a single non-union lineman or groundman was in the employ of the company. The men demanded the dismissal of Mr. Newell, but it was pointed out that these 25 men had not been laid off by him, but by the foreman in the regular course of work. The company, however, agreed to place the case of the electrical superintendent up to arbitration while the electrical workers should go back. This solution was accepted by the joint executives of electrical workers and street railway men, who promised to recommend it to their members. The street railway men met on Monday and car service was resumed the same afternoon. The electrical workers met on Monday night but refused to carry out the recommendations of their executive and demanded the dismissal of the superintendent immediately.

The arbitrary attitude of the electrical workers is without precedent in this country. We believe that they will be censured without exception for their deliberate attempt to tie-up the life of Vancouver and district when they shut down all electrical supply without warning or notice on the morning of July 14. This has ceased to be a matter between the B. C. Electric Railway and the employees. It is a matter for the public and for governments to settle—whether they will allow any person or body of persons to close down such essential services as electric light and power without a moment's notice and without responsibility for the consequences. The men may have the right to cease work, but they have not the right to tamper with the company's property, thereby inconveniencing thousands of persons and causing destruction of property and death.

Hydro Development at Armagh

A small hydro-electric development is in course of construction at Armagh, near Levis, P.Q., from plans by Messrs. Gauvin & Beauchemin, consulting engineers, Quebec. The water power is on the Armagh River, and it is proposed to develop 400 h.p. as a minimum. The plans provide for the erection of a concrete dam, 81 feet high, with a concrete power house 20 x 30 feet. The wooden penstock will be 450 feet long. Two 180 kw. generators, supplied by the Canadian Fairbanks-Morse Company, will be direct connected to horizontal turbines, made by the William Hamilton Company, Peterborough, working under a head of 88 feet. The power will be used for manufacturing purposes. The Canada Electric Company, Montreal, are the contractors for the electrical equipment.

The Dominion Railway Board has granted the Hamilton Railway Company permission to increase their passenger rates subject to the limitations created by municipal franchises. So far as the town of Burlington is concerned, therefore, there will be no change, although the fare to intermediate points may be increased. There is no agreement in the town of Oakville covering radial fares, and increases at this point will no doubt go into effect shortly.

Incorporation has been granted to the Globe Electric Company of Canada, Limited, Winnipeg, as a joint-stock company. The capital stock is $100,000.

Front show window—Interior lights on, window off.

Front show window—Interior lights off, window on.

London Hydro System in New Building

The London Hydro-electric Commission have just moved into a fine new administration building, some features of which are illustrated herewith. It will be seen that the commercial end of the enterprise is exceptionally well taken care of, for it is doubtful if more beautiful and attractive demonstration and sales rooms are to be found anywhere in Canada. One of the views shows the interior of the main room; another shows a section of the basement. In this latter the lighting arrangements are particularly good; the majority of the light is obtained from artificial windows in the wall shown at the right hand of the photograph; this is a false wall and behind it are mounted numerous lamps, the light of which is directed outward against the real wall and reflected back into the basement through ground glass window glass; the reflecting wall is painted sky blue, so that the final effect is that of an almost perfect daylight. The photograph shows that the distribution is as good as could be desired, there being practically no shadows.

The other two photographs are exterior views of the show windows. In one of the photos the window lights are off and the interior lights on, and in the other window lights are on and the interior lights off. This latter picture demonstrates the very good effect obtained by means of window lamps concealed in the archway above the window with prism glass mounted along the under side of the arch.

The foundation of the building is concrete, with the superstructure in gray Indiana limestone. The partitions are of gypsum block; wire glass windows are used in all partitions. The floor of the main room, shown in the photograph, is tile, and the finish is Laurentian marble. Steel trim is used throughout, treated to imitate Circassian walnut. The only wood used in the building is said to be the top of the counters. The stairs leading from the first to the second floors are also Laurentian marble.

General Manager E. V. Buchanan, who is largely responsible for the planning of this fine building, states that it is modelled to a very considerable degree on the New York Edison Company's plan, though, of course, on a smaller scale. The building is approximately 50 x 90 feet, three storeys and basement. In the meantime the third storey is being oc-

Interior Main Business Office—London Hydro.

A section of the basement—Lighted through a false wall.

New Administration Building of London Hydro System.

opened on July 10, when invitations had been widely issued by the government to Hydro supporters throughout the province.

Fire Loss in Canada Greatest in World

A report just issued by the Commission of Conservation on the fire waste of Canada shows us up in a very unenviable light. The fact is that **our fire loss, per capita, is the greatest in the world,** amounting to approximately $3.00. This is a big load for every man, woman and child to carry and seems all the heavier because it is unnecessary and unreasonable.

Of course, it is useless to argue that this loss is borne by the insurance companies. It all comes out of the people—directly out of those who pay premiums and indirectly out of those who do not, for fire means a national loss which is shared by all. And the property loss is not all—there is the inconvenience, the loss of business, of revenue, of wages—all clogs in the wheels of our national industries. And to think that much, very much, of this is due to sheer carelessness! The report summarizes the results of the Commission's investigations and offers recommendations for remedying the unsatisfactory conditions:

General Conclusions

1. That the annual loss of life and property by fire in Canada—the latter averaging $2.73 per capita annually for the years 1912-1915—is greater per capita than in any other country in the world, and constitutes an enormous and increasing drain upon the resources of the Dominion, besides most seriously affecting the economic prosperity and general well-being of the people.

2. That such losses can be very materially reduced. This is clearly shown by the experience of European countries which have attacked the problem at its source.

That the loss by fire is chiefly ascribable to

(a) Carelessness due largely from a sense of security created by the present system of fire insurance.

(b) Faulty building construction.

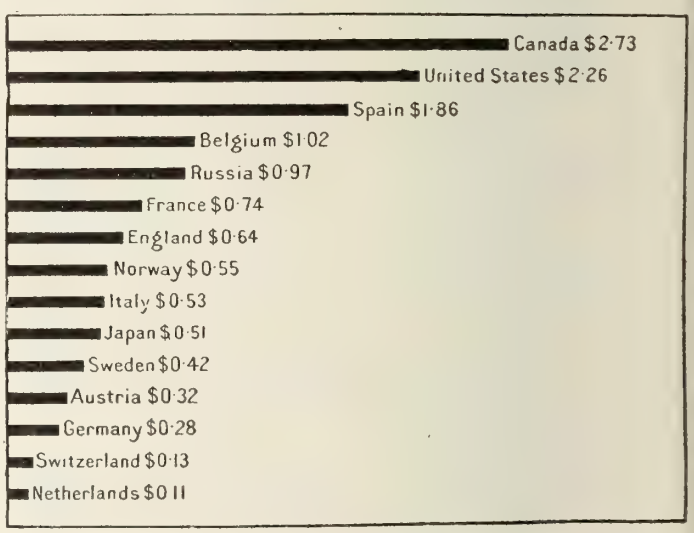
(c) Arson.

(d) Lack of adequate fire prevention laws, such laws as exist being poorly enforced.

4. That, for immunity from the danger of fire losses, the people of Canada are relying largely upon elaborate and expensive systems of fire-fighting and are giving too little attention to the prevention of fire.

5. That our fire departments, while among the best in the world in both apparatus and personnel, are not preventing the steady growth of losses.

6. That the monetary indemnity provided by fire insurance does not restore the values destroyed, but merely distributes the loss, through the channels of commerce, over the whole people.



7. That the cost of fire insurance and fire prevention is, in a large measure, determined by the amount of the fire loss and cannot be expected to decrease except as the fire waste declines.

8. That, although the aggregate loss by fire constitutes a national problem, all fires are local in origin and are, therefore, locally preventable and controllable.

9. That property owners generally have not been sufficiently influenced by their own interests or the welfare of the country at large to use effective means to correct fire-waste conditions.

10. That existing legislation respecting the prevention of fire is inadequate and lacking in uniformity.

11. That such legislation is almost entirely confined to

Annual per capita fire loss in Canada and other countries.

cities and more important towns, and that the dangers and hazards of fire in small communities and rural districts are without regulation or control, despite the occurrence of a large proportion of the fire waste in rural districts.

12. That the only possible solution of the national fire-waste problem lies in the adoption of compulsory measures which, by reducing to a minimum the fire hazards in all communities and properties, will prevent the occurrence of fires.

13. That, owing to the failure of local authorities to deal adequately with the situation, the provincial governments should undertake the removal of a burden imposed upon the whole people and should safeguard the lives and property which, in the final analysis, constitute the true wealth of the country.

Government control of the telegraph, telephone, cable and radio systems in the United States was put into effect on July 31. Authority to operate the lines is vested in the postmaster-general.

The Oxide Film Lightning Arrester

By Crosby Field*

This paper will be confined to a brief statement of the scientific principles underlying a new type of lightning arrester called the "oxide film arrester." The functioning of this arrester depends upon the fact that certain dry chemical compounds can be changed with extreme rapidity from very good conductors of electricity to almost perfect non-conductors by the application of a slight degree of heat. Lead peroxide is a good example of such a substance. It has a specific resistance of the order of one ohm per inch cube. The resistance varies with the pressure to which it has been compressed. At a temperature of about 150 deg. cent. the lead peroxide (PbO_2) will be reduced to red lead, commercially known as minium (Pb_3O_4). This has a specific resistance of about 24 millions ohms per inch cube. At slightly higher temperatures this minium will be reduced through the sesquioxide (Pb_2O_3) to litharge (PbO), which last named is practically an insulator. [A megger reading of infinity is obtained on a column 3 millimeters long (0.11 in.) and 5 square millimeters area (0.2 sq. in.)]

Again the oxides of bismuth give similar characteristics. There are, furthermore, several other compounds and mixtures of compounds that will give these same results.

Lead peroxide is normally in the physical state of a powder. If this powder be placed between two electrodes and a current passed, the temperature due to the resistance at the contact of the peroxide and the metal will cause heat to be generated locally at the surface. When this heat is sufficient to create a temperature of about 150 deg. cent. a film of the lower oxides of lead forms, producing a film of insulation which stops the current. This method of film formation over any large area is rather irregular, and of course the oxide is not used in such a fashion in the commercial arrester. Instead of this formation of litharge film any insulating film may be put on the electrodes initially. As insulating film spread on the metal plates there have been used thin layers of the following: glass, water glass, halowax, cloth, balsam, shellac, oil, paints, lead paints, varnishes, and lacquers of all available kinds. In all cases the results are similar, varying only with the voltage at which puncture of the film of insulation occurs.

The foregoing statements define the principle of the commercial oxide film arrester. It comprises two sheet metal electrodes set about 0.5 in. apart, one or both covered with a thin insulating film and the space between the plates filled with some such substance as that described above as, for example, lead peroxide. At a permissible voltage of 300 volts per cell the insulating film prevents any appreciable current flowing under normal conditions. As soon as the voltage rises slightly above normal the film punctures in one or more microscopic points, the lightning charge meets with practically no resistance and flows to earth, Fig. 1. The dynamic current starts to follow, but because of the fact that the insulation was punctured in such fine points, the current density near these points is exceedingly great. This results in a localized heating which speedily raises the temperature to a value sufficient to change to insulating litharge all the conducting peroxide in this minute path of the current flow in contact with the electrodes. The film consequently reseals, stopping the further flow of dynamic current. This action is so rapid that its duration cannot be measured on an oscillograph giving two thousand cycles per second, that is to say, the action of resealing occurs in less than one four-thousandth part of a second after the excess of lightning voltage has ceased.

Fig 2 shows a magnified, imaginary representation of one of the films on one metal plate. As shown, the film is punctured by a spark and filled with a litharge plug which is represented by the open circles. The cross-section in the discharge path, a short distance away from the metal electrode, is sufficiently expanded to make the current of low enough density not to heat the peroxide to a temperature of reduction to litharge. The peroxide is represented by the solid dots and only those in the path of the discharge are shown. At the other electrode, not shown in this magnified diagram, a similar effect may be taking place, although there is a difference between the positive and negative crators.

This film can be made of litharge itself, as well as any of the insulating materials above named. For example, metal plates may be inserted in any of the well-known lead electroplating solutions, and thus a very thin lead peroxide film (measuring a few hundred thousandths of an inch) formed. By proper heating this will be changed to litharge and this form of electrode can be used. Peroxide may also be sprinkled over any metal plate and the plate heated, which will reduce the peroxide to litharge. Again, the metal chosen for the electrode itself may be lead and if heated in the air a thin film of litharge will be formed on the surface. Again, an aluminum electrode may be put in any of the common electrolytes, and a thin aluminum film be built up. This may be used with the peroxide powder. Of these methods of forming the film the most preferable is by dipping in varnish or lacquer highly burnished surfaces of brass, steel, or copper, and is consequently used in the commercial arrester. The ohmic resistance of the arrester during discharge is quite low (less than 1 ohm per cell). Thus, when the insulating film is punctured the arrester offers very slight impedance to the flow of energy at abnormal voltages.

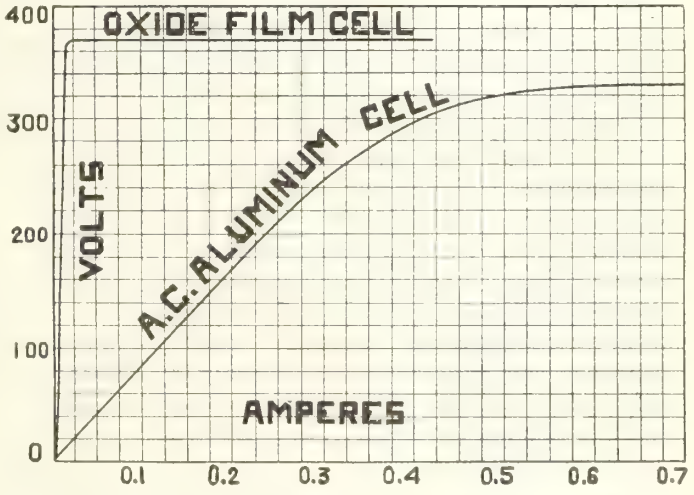


Fig. 1. Comparative Characteristics of Oxide and Aluminum Cells

There is a certain range of voltage necessary to pierce any given insulation. The exact voltage depends not only upon the thickness of the insulation and its dielectric strength but also on the relation of the dielectric spark lag to the duration of the super-spark potential and the frequency of alterations of the transient surge.

If an arrester is to give protection of insulation in shunt

*Before the A I.E E. Convention

with it the arrester must relieve the abnormal electric pressure before damage is done to the insulation. Although tests are frequently made with the arrester and the insulation (it is to protect in parallel, a more convenient method has been standardized and is known as the equivalent sphere gap test. Both the insulation and the arrester are compared by comparing each to the equivalent sphere gap.

The equivalent sphere gap of the oxide film arrester may be analyzed, as in other cases, into separate and distinct parts. First, there is the equivalent sphere gap of the main gap to initiate a discharge through the insulating film on the plate surface of the cell. Third, there is the equivalent sphere gap of the resistance drop of the current discharging through the powdered peroxide in its path. Fourth, there is the equivalent sphere gap of the inductance of the arrester.

Commenting on these factors in their relation to this

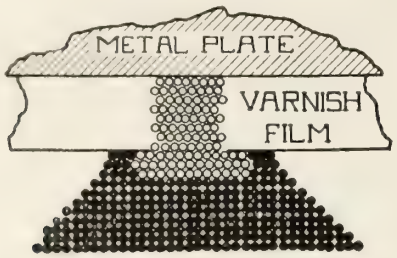

Fig 2. Imaginary representation of Oxide film on one metal plate

arrester, the main gap is itself a sphere gap which has the fastest spark of any practical gap. The gap setting, like that of the aluminum arrester, is only slightly above that of the normal voltage of the circuit.

The equivalent sphere gap of the film is several times greater than the thickness of the film because solid material has a greater dielectric spark lag than air, but with this multiple of the thickness of the film the equivalent sphere gap is still low. Since peroxide is a good conductor, the series resistance in the path of the discharge is insufficient to give an undesirable voltage drop. As to the inductance of the arrester, it has a minimum value due to the fact that each cell is only 0.5 in. long, and these cells are placed one on top of another. In other words, the total length of the arrester (which constitutes the inductance) is short as compared to the necessary length of conductor from line to earth.

One of the obstacles that had to be overcome in the making of this arrester was the increase in the resistance after a great many heavy discharges had passed through it. The predominant reason for the increase seems to be explained by the following theory. The current passing through this small puncture in the film heats up very rapidly not only the powder but also the air contained within the interstices of the powder. The particles are thereby thrown out of contact with each other, thus producing a fluffiness. The decrease in the number of contacts decreases the actual cross sectional area of conduction and hence increases the resistance. This raises the equivalent sphere gap. This action is accelerated, of course, by the giving off of the oxygen itself evolved in the reduction from lead peroxide to the lower oxide. If, however, this same arrester be violently jarred or the filling powder be compressed, or any other method utilized to restore the particles to their previous intimate contact, the equivalent needle gap will fall again. While increased fluffiness appears to be the predominant cause of change of the equivalent sphere gap, the increased thickness of the film of litharge at the point of puncture of the film is finally a factor of moment. The total area of the film must be sufficient to give a reasonable number of years of life to the arrester. There are other factors relating to the details of manufacture which give a limited degree of control over this change in equivalent sphere gap.

In all the commercial oxide film arresters used for alternating current the power factor is nearly unity. For special purposes however, the power factor can be made anything desired from 10 per cent. to unity. This is obtained by combining with the conducting oxide other non-conducting materials. This principle has been made use of for condensers, but it has not been found desirable to incorporate it in the arrester.

To summarize—an arrester operating under a new principle has been made which comprises in essence one or more metal electrodes covered with an insulating film, and separated by a conducting powder, which has the peculiar characteristic of becoming a non-conducting powder upon the application of heat. Voltage higher than that which can be withstood by the insulating film punctures it in one or more points of about 0.005 cm. diameter. Dynamic current flowing gives a high current density in the conducting powder adjacent to these punctures which in turn heats it up rapidly, reducing the powder to a non-conductor, and sealing the holes in the film. The powder being a poor heat conductor localizes this action, so that very little more powder is reduced than is actually necessary to seal up these minute punctures.

The critical spark voltage and that part of the equivalent sphere gap controlled thereby is a function of the thickness and kind of material used for the film.

Comparison of the "Oxide Film" with Aluminum Arrester.

The earliest form of non-electrolytic film arrester was known as the dry aluminum arrester. It was a direct attempt to utilize the dry film which forms on the surfaces of pure aluminum immediately after it comes in contact with the oxygen of the air. The hydroxide film is easily formed in electrolyte and on drying becomes a dry film which gives sufficient action to prevent a discharge up to a given critical voltage, depending upon the thickness of the film. The film can also be formed by a spark or arc of a conductor in contact with a plate. Naturally this conductor should be of a non-metallic nature. In the earliest form tried powdered carbon was used mixed with dioxide of maganese which gives a liberal supply of oxygen at the heated point.

One of the objects of the development of this arrester was to decrease the cost of manufacture and it was found with the new principle involved in the oxide film arrester, where the powder furnishes the film rather than the plate, that the aluminum could be replaced by a cheaper metal, such as steel, and, as already described, the initial film known in the early stages of development as the "paint skin" type could be furnished by a layer of varnish. On first sight, knowing the extreme thinness of the hydroxide film on wet aluminum cell it might not seem that the dry cell would give the same general characteristics as the wet cell. But a comparison of the volt-ampere curves shows the same general characteristics. For a.c. voltages of 300 volts average per cell the current in the dry cell is of negligibly small value up to 40 milliamperes. The power-factor is nearly unity and the current flow is due to very slight leakages through the films. In the case of the aluminum electrolytic cells there is an equivalent condition, the d.c. leakage current of the order of one milliampere being due to leaks through the hydroroxide film. In the a.c. aluminum arrester the leakage current on the plate area used is much greater, due to the destructive action of the alternating current on the hydroxide film. Furthermore, the wet cell with its thinner film is a condenser of appreciable capacitance which takes a charging current of about 0.5 ampere at 60 cycles. When the voltage reaches a certain critical value which is between 300 and 400 volts for the wet aluminum cell

and between 300 and 500 for the oxide cell (or higher if the paint film is made thicker) the current is allowed to pass freely through the cells, limited only by the ohmic resistance of the cell independent of the film. Since the oxide film arrester has no dissolution of the film, as occurs in the wet aluminum cell, charging is not only unnecessary but undesirable. This extends the use of the oxide film arrester to localities where there are no attendants.

Although the wet aluminum plate becomes frosted to an appreciable thickness by the passage of current in long use, the actual thickness of the film, as represented by the critical voltage, is not changed. In the oxide film arrester, however, the film less than one 1 mil thick initially thickens up by the addition of successive spots of litharge for each successive discharge. This represents the wear on the arrester and limits its total life. Fig. 1 shows comparative volt-ampere characteristics of the oxide film arrester and the a.c. aluminum arrester. Since both of these arresters have a leakage current which wears the plates of the cells when alternating current is supplied, it is necessary, as previously stated, to place a spark gap in series with the cells. This spark gap is set at a value slightly above the normal potential of the circuit so that nothing but abnormal voltages will cause a discharge.

The Electric Vehicle as a War Measure

By James H. McGraw*

Transportation is one of the vital problems of the day. it deserves the attention of the biggest men in every industry. War has enormously increased congestion in factories, on railroads, in warehouses and terminal yards, and on our city streets. We have more raw materials and more products to handle with fewer men, and with the need for real economy in handling costs.

More minds are being concentrated on transportation than ever before. Government officials, Washington Bureaus and War and Navy Departments, as well as engineers, central station men, electrical engineers in industrial plants, all are considered parts of the problem.

A brief survey of transportation problems in this country brings striking facts to light. Forty-five per cent. of the population live in 11 per cent. of the area of the United States, This restricted area includes N. E. States, New York, Pennsylvania, New Jersey, Maryland, Ohio, Indiana, and parts of Illinois and Michigan.

Of all goods made in the United States, approximately 70 per cent. are made in this area. This concentration of population and manufacturing brings naturally a congestion of traffic, that is little realized until a tremendous added burden is put on it by war needs.

Within the congested area is a still smaller zone which to-day is the red flag zone of the government departments. In this zone, which borders the Atlantic and extends from Baltimore to Maine, there are no raw materials, no bituminous coal, no iron nor other base supplies. To get these raw materials into this region they must go through four gateways, located at Williamsport, Altoona, Shippinsburg and Baltimore. To get coal and basic supplies into the great manufacturing district of New England, where there are so many war plants, there are three gateways: Harlem River, Poughkeepsie and Albany.

No Time for Building

We must win this war with our present main equipment. We haven't time to build more gateways, more railroads, more trunk lines. The so-called red-flag zone this next year will require 90,000,000 tons of bituminous coal, 80,000,000 tons of hard coal. All this product must go through the four gateways.

What does this mean? Broadly, it means that we must concentrate our attention on auxiliary means of transportation to move goods faster and transfer goods more quickly at this point. Every freight car must count. According to lately gathered statistics we need 150,000 cars for replacement alone. The government ordered 100,000, a tremendous order, it is true, but only a part of what is needed to handle materials.

Electricity offers three means of auxiliary aid to the steam railway freight problem at this time. Various classes of hoists and transfer cranes and platforms operated by electricity are in use. Second, there is the industrial electric truck, a low-body, small wheel vehicle which is being used for transfer work in government yards, docks and terminals, munition factories, and so forth; and third, commercial electric trucks for short-haul many-stop deliveries from warehouse to merchant, from merchant to customer.

In both these fields the electric vehicle is now performing work of direct help in war service, and there is a very real opportunity to extend this development tremendously.

Electric industrial trucks are being used more extensively than generally realized in direct government work. Hundreds of trucks are in use at embarkation and debarkation points. Practically all goods going into France are handled at some point by electric trucks. Special trucks with crane, and hoist attachments have been developed. Because of the nature of the work, it is not possible to describe these applications in detail.

Operation Costs

The average cost of operating an electric industrial truck of this kind, including tires, battery upkeep, mechanical repairs, charging, drivers' wages and interest on investment, is between five and six dollars a day. In many instances one truck will do the work of four to six men. In one instance, a truck saved eighteen men a day. These trucks have a speed of five miles an hour loaded, and a capacity of two tons. They are particularly serviceable in operation in munitions factories because the risk of fire is practically negligible. These trucks are being built by hundreds. There are estimated to be 5,000 in use to-day.

Specialized electric trucks for government service have also been built for hospital supply wagons ar l ambulances at base hospitals. An electric kitchen wagon also has been built.

Electric tractors are in operation at the navy yards and supply depots for hauling ammunitions cars.

The war has especially shown the inefficiency of our methods of handling goods out of cars, across platforms and into warehouses. Goods are handled and rehandled without regard to time or labor. This is one of the biggest parts of our transportation problem.

It should be a matter of pride to realize that electricity at the terminals and gateways is helping to move goods cheaper and faster. The industrial electric truck, the electric driven overhead crane, the hoist and telpher systems operated

*Before the N.E.L.A. Convention

by electricity, the night illumination, are all factors in this problem.

Electricity Doing the Job

Electricity is helping to get the job done, and the demand for the industrial electric truck for this work is ahead of the supply, although the trucks are being turned out by several manufacturers. For loading and unloading steamships the electric industrial truck has found a place, ont only because it saves time and labor, but because practically every other type of power vehicle is eliminated from both docks and steamships by insurance companies on account of fire risks.

Industrial electric trucks are helping to get work done in munition factories and arsenals. They have revolutionized the methods of handling goods in many plants. These factories need to-day to increase output by every possible means. They also need to conserve men, both laborers and mechics. The industrial electric truck replaces men, speeds up production, and is so simple a mechanism that it requires little skilled attention.

As a concrete example of what an industrial truck will do, the Packard Motor Car Company have three electric industrial trucks handling scrap metal from the lathes and presses where formerly 48 men were required.

Electric transportation in the factory is simply another example of the widening use of electricity in industries. Central station service and the motor drive have been adopted. The power engineer from the central station has had an opportunity to act as an electric engineer of transportation and to point out to the factory manager just what electricity can do for transportation to his factory.

Local delivery methods are getting the same overhauling as railway, terminal and factory systems. Men are growing scarcer. Wasteful delivery methods can no longer be tolerated. The problem is part of the complete city transportation needs.

Economy in Retail Service

The Commercial Economy Board of the Council of National Defense has just issued a booklet entitled Economy in Retail Service.

The Council of National Defense as a whole also has made this statement: "The Council of National Defense has given its formal approval to all measures designed to facilitate the use of motor trucks in transportation wherever it can be utilized. It is urging all communities as far as possible to adapt the motor truck to their local needs and encourage its use in any way to help existing transportation problems." In neither of these pronouncements is direct reference made to any type of motor truck, but the general idea of replacing horse drawn trucks and perhaps more antiquated delivery systems is being widely promoted. The booklet issued by the Commercial Economy Board is a part of a broad program started in 1917 to show how economies introduced by voluntary co-operation of business would release men, materials, equipment and capital for carrying on the war. The work in retail deliveries was undertaken primarily to conserve labor, to make it unnecessary for merchants who lost delivery men through the draft and other war causes to replace them out of supplies available for ship building, farming, railway transportation, and other war work. A careful survey of the whole country was made among retail and wholesale merchants.

Several of the findings of this survey point particularly to present opportunities for the electric vehicle to meet the problem of local delivery under war conditions. In Massachusetts it was found that 5,230 stores, about half in the state, operated 4,473 vehicles. Of these 3,129 were horse drawn and 1,344 motor trucks. This general proportion of horse drawn and motor propelled trucks holds for the country.

Cutting Costs of Retailing

A second point in this general investigation worth the attention of the electrical industry, is the relative importance of this transportation cost as an element in the merchant's total cost. In the city of Washington, the delivery costs for bakery products averaged 19.8 per cent. of gross sales; for dairy products, 12.1 per cent.; for ice cream, 14.9 per cent.; for coal and wood, 15.2 per cent.; for ice, 45.6 per cent., and for food products, as a whole, 7.4 per cent.

The report contains definite suggestions for changing the methods of delivery. It points out that short haul many stop deliveries generally provide the best service to the customer, and it suggests plans for working out such systems. This, of course, is the ideal field for the electric vehicle. Ninety-five per cent. of the work done by horses on the street can be done by motor trucks. Eighty-five per cent. of the city haulage can be accomplished by the electric vehicle. Figures compiled many times show the inherent economy of the electric in place of the horse drawn wagon. A light truck will move a single horse wagon load of goods one mile for one cent (current at 3 cents per kilowatt hour). Gasoline for that same mile would cost 3 cents and oats for the horse 5 cents. And this is only one element in the cost.

Saving in Hauling Coal

All of the coal used in the Hudson Terminal Building in New York City is hauled from Jersey City by two five-ton electric trucks. By hauling the coal from storage and buying in large volume, the company saves $45 per day. The ferry charges were reduced several dollars a day because the electric for the same capacity was about three feet shorter than a gas truck and so came in a lower class. The cost of handling fuel is one of the elements in our fuel supply that is receiving careful analysis. The electrical truck with suitably adapted bodies is an economical solution of the problem. In one case now being investigated one five-ton truck with different detachable bodies could replace both horse drawn and gas equipment, eliminate surplus equipment and effect a large saving of about 35 per cent. to 40 per cent.

I have briefly summarized the way that electricity is a part of the transportation problem to-day.

The general advantages of the electric vehicle as a part of the big transportation problem may be summarized as follows:

General Advantages

Manufacture—Simplicity of design requires few parts, and almost the total absence of machined steel in power plant. Need of skilled mechanics reduced to a minimum.

Operation—Skilled mechanics unnecessary. Young and old, men and women, are successful operators.

Maintenance—Few parts and absence of reciprocating features assures maximum uninterrupted service with minimum supervision and repair, thus releasing skilled mechanics for more vital war work.

Costs-Operating—Lowest for work accomplished of any form of mobile transportation.

Fuel—Current for battery charging taken off-peak. Conditions abroad are not the same as in this country. We are not yet faced with the drastic shortage in liquid fuel and operators that have faced our allies. The fact remains, however, that the electric has filled a very definite place in the transportation development abroad. For example, there have been six times as many electrics put into service in England alone during the past three years as in all the time before. Electrics have been adopted for handling municipal work, for example, in eighteen towns and cities for garbage collection, road construction, street cleaning and coal deliveries. The Midland Railway has about 110 electric trucks in service and the Great Northern Railway, with eight 3½-ton American electric trucks displaced the entire horse unit in Leeds, 33 horses and 16 vans.

The Electric Vehicle Section of this Association has been working with the French High Commission in New York looking forward to the manufacture of the electric vehicle

in France as a part of the great problem of reconstruction and water power development under way in that country.

Norway is to-day an active market for the electric vehicle, both commercial and pleasure cars.

Opportunity for Central Stations

This discussion has been undertaken to bring before this association not the detail economies of the electric vehicle, which are well known, but the opportunity that the central stations of the country have to aid the government by taking an active part in helping to solve the transportation problem as a whole.

The central stations to-day are furnishing light, heat and power to meet war needs and to conserve men and materials in the commercial and domestic life of the nation.

The transportation problem needs the attention of our biggest electrical men. Transportation to-day is handled with tremendous losses. The movement of freight to-day is a transportation engineering question. As an engineering question the electrical industry will play a large part in the future. The supply of electricity for the big developments to come in cheapening the cost of handling goods in terminals and warehouses, and in cutting the cost of deliveries on our city streets is worth the attention of every central station. The electric vehicle to-day offers an economical solution for an important part of our big transportation problem.

More Power From Shaft by Use of Turbine

Electric motor drive, the simplest solution to additional power supply problem, is oftentimes not available to mill owners, whose plants are driven by line shafts. Often, however, there is sufficient boiler capacity in the plant to do the work, if it is effectively applied, particularly where line shaft drive to a small number of machines is used, in which case the installation of a turbine with speed-reducing gears is an ingenious solution to the problem. A unique line shaft drive, consisting of a low pressure turbine and a daubee reduction gear has been installed in a Western Pennsylvania paper mill. There are two main line shafts to which the machines are belted. To one of the line shafts are belted two cutters, ten beaters and one Jordan. An identical equipment, with the exception of the cutters, is belted to the other shaft. Only seven of the ten beaters, under ordinary running conditions, are in operation at one time, and these, with one Jordan, require about 600 horse power, with an additional 20 horse power for the rag-cutters. Heretofore these two line shafts were each driven by a non-condensing reciprocating engine. However, one of these engines was wrecked, which necessitated obtaining a drive to replace it.

It is interesting to note the considerations entering into the final selection of the new drive. These conditions were somewhat as follows: two 100 horse power non-condensing engines turned the rolls and gears and gave practically all the exhaust steam necessary for feed water heating, so that all the exhaust steam from the 700 horse power non-condensing Corliss engine driving one of the line shafts would have to be discharged to the atmosphere, unless some means were provided for abstracting the energy still available in it. A low pressure turbine was the logical prime mover, without a doubt, but it would have been of little use, on account of its high speed, had there not been a reduction gear to receive the power generated and to deliver it to the line shaft at low speed.

While this particular mill was not enlarged, it is evident that with a given amount of exhaust steam, either from non-condensing engines or condensing engines run non-condensing, a large increase of power is made available by the installation of a low pressure turbine. Further evidence of this possibility for expansion is the fact that in this paper mill when the two line shafts were driven by non-condensing reciprocating engines, a battery of 13 boilers was required, whereas, now only eight boilers are required for the maximum load.

So far this has beeen a discussion of the application of a low pressure turbine, but the means of transmitting its high speed power to a slow speed line shaft is fully as interesting and important. The change in speed is made by means of two reduction gears because the first cost of a single gear and pinion of ratio 36 to 11 would be prohibitive, and the gear would be very large and unwieldy. The first speed reduction, 3,600 r.p.m., to 720 r.p.m., is made with a fixed bearing type of reduction gear, the gear shaft of which is direct connected to the pinion shaft of the second gear which reduces the speed from 720 to 103 r.p.m. This larger reduction gear is of the flexible pinion frame, Westinghouse I-Beam type. It is this I-beam feature which makes the application of the geared drive possible.

It may be asked why a fixed bearing type of reduction gear was used in one case and an I-beam in the other. It was a question of tooth pressure which determined the design. Take for instance a pinion transmitting 600 horse power at 3,600 r.p.m., which was the case of the first reduction gear in the particular installation under liscussion. If the same pinion were to turn at 720 r.p.m. and with the same tooth pressure (i.e., pounds pressure per inch) of tooth face it would be capable of transmitting one-fifth of 600 horse power, or 120 horse power only. It follows, then, that the second gear would have been made five times as large as the first if the same type had been used, and for the transmission of the same amount of power. Such reduction gear would have been large and bulky. It would also have been costly, because cost is a function of size.

Hydro Tenth Annual Report

The Hydro-electric Power Commission of Ontario have issued Vol. 2 of their tenth annual report, which covers the year ended October 31, 1917. This report contains a review of the operation of the various systems controlled by the Commission, financial expenditure on each, quantity of power used, extensions made during the year, and so on. The horsepower load on the various systems in October, 1917, was as follows: Niagara, 121,538; Severn System, 7,854; Eugenia System, 1,715; Wasdell's System, 275; Central Ontario System, 17,426; Muskoka System, 920; St. Lawrence, 739, and Ottawa, 6,500. The expenditures noted on the various systems are: Niagara, $14,386,531; Severn, $867,971; Eugenia, $1,271,736; Wasdell's, $264,731; Muskoka, $190,239; St. Lawrence, $207,234; Ottawa, $433,000; Port Arthur, $109,438; Renfrew, $20,389; Central Ontario, $9,505,249; Ontario Power, $7,996,617. The grand total of expenditure to date is placed at $37,176,901. The report also contains information covering the financial operations of the various municipalities throughout the province—their rates, expenditures, earnings, etc.

In order that the financial difficulties of the city of Prince Albert, Sask., due in a large measure to the expenditure of over a million dollars on the abandoned La Colle Falls hydro-electric scheme, may be overcome, it is proposed that the Saskatchewan government should lend $50,000 a year for a few years at a low rate of interest, and debenture holders be asked to agree to the suspension of sinking fund payments for a similar period, pending the reorganization of finances.

A new Bell Telephone exchange at St. Hyacinthe, P. Q., will soon be put in. A change will be made from magneto to central energy service.

Teaching the Public Why Higher Fares are Essential

The Cape Breton Electric Company, operating an electric railway in Sydney, N.S., recently made application to the Public Service Commissioners of their province for an increase in fares. It is indicative of the changed attitude of the average public service organization toward the people it serves that coincident with this application the company inaugurated a systematic campaign of advertising in the local press in an endeavor to advise the general public of the facts and educate them up to the point where they will be able to make a fair judgment on this question. The average citizen does not stop to consider that the cost of operating an electric railway system has increased in about the same proportion as the price of the average commodity he buys, whereas the rate of fares which the railway company is allowed to charge for its service remains fixed. If 5 cents was a reasonable charge for the average rate four years ago, then, by the law of averages, it should cost 7, 8 or 9 cents to provide the same convenience to-day. As a matter of fact, though this rate would be justified in many cases, no company has asked for any such increase. They have first turned their attention to every possible economy, and now, all sources of revenue having been exploited, they are forced to ask for fare increases.

The form which the advertising of this company, under the control of C. C. Curtis, manager of the company, has taken, is an advertisement about 7 x 10 inches in the form of "One-Minute Talks." For example, in Talk No. 8 there are a few paragraphs explaining how the prosperity of the company and of the public go hand in hand. Talk No. 11 explains about the appointment of a select committee to look into the same question in the British Isles. Talks Nos. 12, 13, 14, 15 and 16 are along the same lines, each of them pointing out one separate viewpoint which is probably new to the railway patrons. As typical of the form these arguments take we are reproducing three of them below:

A campaign of a similar nature is also going forward in other Canadian cities. For example, in Montreal, where the Montreal Tramways Commission conceded the company the right to increase the fares, an effort is being made to prevent the execution of the order. It is surely a perverted idea of justice that would require a tramway company, or any other public utility, to continue operation at a loss, but this is what is demanded of the Montreal Tramways Company by a portion of the city. To correct the false impression being created by the propaganda of these people this company also is having resort to the daily papers. Following are a couple of their recent advertisements:

One Minute Tram Talks — **Talk No. 12**

Capitalization Does Not Affect Fares

For when it comes to a question of what price a Public Utility may charge the public the consideration of the amount of stock and bonds which it has outstanding is all cast to one side.

The Public Service Commissioners ascertain the fair value of the property used for the benefit of the public, what the owners have received on that fair value in the way of income and what will be received in the future. They ascertain the earnings and expenses and the needs of the Company for proper up-keep.

After thorough investigation they will render their decision based on the law which allows a Company to earn at least 6 per cent. on its actual investment.

The Company never has earned this amount and will not with only the small increase in fares now proposed.

C. C. CURTIS, Manager,
Cape Breton Electric Company, Limited.

One Minute Tram Talks — **Talk No. 16**

THE FACTS IN A NUT SHELL

Their earnings are strictly limited by law and Public Utilities cannot make war profits. If they make war losses they can seldom recover them. Therefore they must be kept financially sound and healthy at all times if they are to fulfil their duty to the public.

The increase in fare asked for is estimated to bring in about $30,000.

All this and more is needed to take care of increased wages and increased costs of material and to keep the property generally in good operating condition.

We hope for your support, not only in our own interest, but also in yours.

C. C. CURTIS, Manager,
Cape Breton Electric Company, Limited.

One Minute Tram Talks — **Talk No. 8**

Your Prosperity and Ours Go Hand in Hand

Are we interested in your prosperity?

Most decidedly, YES.

Personally we are interested because prosperity is more conducive to happiness than poverty and hard times.

In a business way we are interested because our Company cannot prosper and grow unless you and the community in which you live have a fair share of prosperity.

We are dependent upon you.

Are you interested in our prosperity?

We believe you are.

You depend upon us for tram service, for transportation to and from work; to and from play.

You could walk but then you wouldn't have the time you now have for work and for play.

If we are not prosperous we cannot furnish good service; we cannot improve our service.

If a merchant's expenses are greater than his income he quickly goes out of business.

We are subject to the same laws of business and common sense.

C. C. Curtis, Manager,
Cape Breton Electric Company, Limited

Tramways and the Rising Tide

Unprecedented increase in cost of material eats up earnings rapidly

The unprecedented increase in the costs of all materials used in construction and operation of street railways, has placed the street railway business in a very serious position. In most cities in the United States the 5-cent fare which has prevailed for many years has been found to be quite insufficient to enable them to do business at a profit, and testimony before various Public Service Commissions has shown that many of the companies are heading straight toward bankruptcy—or will be if relief is not granted in the shape of higher fares. Not half of the Upstate companies in New York States, for instance, are earning even their fixed charges, and matters are growing worse. In some cities fares have already been raised to 6 cents or higher, and practically every important street railway company in the United States is applying for an increase.

Exactly the same condition of affairs confronts the Montreal Tramways. Since the war broke out the costs of all materials, supplies, and labor, have increased enormously. Everything the street car companies buy or do costs more money than ever before. Here are the main facts of the present situation in the Montreal Tramways Service:

1. The ticket has been buying more and better car service for you every year since street railways were invented.

2. The ticket buys for the company less than it ever did of the labor and materials needed to give service.

It takes nearly twice as many tickets to pay for the Montreal Tramways Company's supply bills as it did five years ago.

The reason why the quarter's worth of tickets has shrunk to a value of 15 cents is shown by the following increases in prices, as compared with the prices paid in 1913:

Increase in prices 1918 as compared with prices in 1913:

	Per cent.		Per cent.
Asbestos	250	Motor Equipment	105 1/3
Armatures (W. H. 533)	104	Nails	112
Axles	171	Nuts	109 2/3
Babbitt	147	Switches, electric	110 3/5
Brooms, corn	118	Pins, cotter	112
Brushes, carbon	200	Paint	85
Brass, sheet	200	Plumbers' fittings	100 to 130
Buttons, push	150	Poles trolley	100
Car Bodies	50	Pinions	300
Castings	160	Rope	100
Charcoal	140	Rivets	150
Copper, sheet	128	Rattan	760
Chain	192	Rails	140
Cement	89	Rods, tie	125
Controllers	100	Solder	144
Coal, run-of-mine	110	Screws, iron, wood	129
Slack	143	Screws, brass	200
Switches, track	119½	Steel, mild	137
Fibre	141	Spikes	158
Glass	235	Shellac	176
Gears	180 1/3	Tacks	200
Gear Cases	215 1/5	Trolley bases	104
Heater Equipment	113	Tin	108
Iron, wrought	156		

Increased Rates Granted to Public Utility Companies

The movement for higher fares on the Street Railways, caused by unprecedented increases in the cost of materials and operating is now general throughout the United States. The following are some of the fares recently put in force:

St. Louis, Mo.	6 cents
Kansas City	6 cents
State Railways of Missouri	6 cents
Middlesex & Boston Street Railway	7 cents
Philadelphia	6 cents
Buffalo (authorized by city)	6 cents
Portland, Ore.	6 cents
New Haven	6 cents
Scranton	6 cents
Fall River	6 cents
Bridgeport	6 cents
New Bedford	6 cents
Lowell	6 cents
Hartford	6 cents
Reading	6 cents
Lynn	6 cents
Lawrence	6 cents
Sioux Falls	6 cents
Wilmington	7 cents
Pittsburgh	5-7 cents
Edmonton, Alta. (municipally owned)	7 cents

Forty-one other cities in the United States of over 100,000 population, including New York, Chicago, Baltimore, Minneapolis, Indianapolis and Albany, have applied for a 6-cent fare or higher, and the applications are now being considered.

The Administrative Commission of Montreal have been in conference with the representatives of the Montreal Light, Heat & Power Consolidated, Montreal Water & Power Co., Bell Telephone Co., Public Service Corporation, Montreal Tramways Co., and Dominion Gresham Guarantee Co., on the subject of repairing breaks in the streets. It was agreed to abolish the old fixed rate of $2.50 a cubic yard paid by the companies and that the latter pay the actual cost of repairing the roadways after the excavations have been made. With a view to the general convenience, it has been arranged that the companies make deposits of lump sums; when a company applies to break up a road, an estimate of the cost of repair will be made by the engineering department of the city, and the permit granted if there be sufficient money on deposit to cover the cost. No road is to be broken up without a permit, except in very exceptional circumstances, such as breaking of water or gas mains.

Mr. Justice Lafontaine, in the Superior Court of Quebec, has just ruled that poles and wires of telegraph systems cannot be taxed as "immovable property" for school or municipal revenue. The school commissioners of Lachine, Que., had brought an action against the Great Northwestern Telegraph Company asking that the poles and wires of the company—no mention being made of the number or place—be hypothecated for the recovery of $20.80 alleged to be due as school taxes for the years 1915-16-17. The action was dismissed.

Fares on the Tacoma street railway have been raised to 7 cents.

The Dealer and Contractor

The Manufacturer's Relation to the Contractor

By J. Nelson Shreve*

At times it seems as if the manufacturer's interest often ended at his own shipping door. Nowadays more and more manufacturers are realizing that in the electrical business the retailer posseses even more power to make or mar the product of a manufacturer than in other lines of industry where less engineering is involved. Besides this consideration of the contractor's ability to assist in the engineering end, we have a consideration of the fundamental economic principles of all business. Unless these are understood and industry based upon them, its foundation is of sand. In the past there have been too many sand foundations. It is true we are getting away from this period, which was due largely to the fact that economic principles were regarded as purely academic. The idea of applying them to everyday commercial life was thought Utopian. If they are sound they are practical, a truth which every business man must recognize. As a nation we have in the past been handicapped in our industrial development by too much individualism and too many laws supporting it. We are just entering the age which older nations entered years ago—the age of co-operation.

Efficient co-operation is possible only when the functions of every factor in an industry are clearly understood, and their interrelation honestly recognized by everyone in the industry, and when each is supported by all in the exercise of its proper functions. This is the only sound basis for practical co-operation, and it seems to me no one has presented this so clearly as Mr. Goodwin.

Two Primary Parties.

So far as the electrical industry is concerned there are two primary parties to every transaction—the manufacturer and the ultimate consumer, or, I might say, the public. A sale is not completed until the goods are in service, the final payment made and the public's approval obtained. This approval does not depend solely upon the manufacturer, and it is not determined immediately but only after satisfactory service for years. Between the manufacturer and the public are interjected several important factors: The jobber upon whom many manufacturers depend for the distribution of their product, and the contractor who installs it. The architect and the engineer are also important, though indirect factors, as they are responsible for planning the electrical system and advising the ultimate consumer as to the quality of materials. However, the manufacturer is principally concerned with the jobber and the contractor. The foregoing is general and I shall now consider specifically the points raised.

*President of the Electric Cable Company, before New York State Association of Electrical Contractors and Dealers.

Responsibilty to the Public.

The manufacturer must at all times be conscious of his responsibility to the public, if he would secure and hold its approval. This is the very essence of a successful business policy. It means that his goods must be of a quality that will insure their rendering the public efficient service. In establishing prices he must consider the following:

(1) What are the most economical units in which he can manufacture?

(2) What is a fair additional cost for disbursing them in quantities ordinarily used by the wholesale trade?

(3) What further costs are justified when distributing goods in quantities suitable for the retail trade

These are important considerations in cost accounting, and any manufacturer who ignores them is fooling himself, as well as the public. Recognition by the manufacturer of the service function fulfilled by the electrical jobber and the electrical contractor takes the form of discount. Now everyone, I believe, will agree that there are only two reasons for discount—quantity and service, either or both. A concern that claims maximum discounts from a manufacturer on any basis but that of quantity and service, should not have the claim recognized. The fact that a concern is in the electrical jobbing or the contracting business, or a member of an association, is not sufficient reason for according the recognition asked. To do so would be unjust to those whose services entitle them to the maximum consideration. Manufacturers' selling schedules should be arranged on a basis of differentials which attract and encourage the wholesaler to buy in the most economical units, and the retailer, in turn, to buy as to render maximum service to the manufacturer, the jobber and the consumer.

"Reputation" is Proper Basis.

Reputation, which forms the basis of business building, necessarily plays an important part. What encouragement is there for a manufacturer of high quality materials to give the maximum recognition to a jobber or retailer whose policy is formed solely on price Or to a contractor who sells his services not on the basis of quality but of cheapness? None whatever. I nthe first instance, he is encouraging the inefficient distribution of his product; and in the second instance, he is promoting a quality of work that may make it impossible for his goods to render the service they are capable of rendering. The result is loss of the public's approval. I am presenting no new thought. The facts I have called attention to are well known, but they are not always given proper consideration in establishing a sales policy, and, therefore, reiteration is justified.

Right Also in Practice.

I know the argument that will be advanced in some quarters in opposition to this policy. It will be said that theoretically it is all right, but that competition makes its full practical application impossible. This is not true. The policy is all right in theory and in practice; it is the only sound, economical policy; it can be applied fully and con-

tinuously. I know this is true because I have studied it in older industries and other branches of the electrical industry, and have proved it in my own company. I make this latter assertion because first-hand experience is the most convincing. The public does not demand unfair competition but it wants all that it pays for. Think of the leading concerns in any line of business. Have they attained their position by selling cheap or by selling on the basis of service and quality, with the recognition of the fundamental principles of all business? The question answers itself. It is not worth while wasting time on a prospective customer to whom you cannot sell policy, quality and service, as well as material goods.

Cost Accounting.

The electrical industry is comparatively new, and one of its most serious faults is that it has not developed scientific merchandising to the same extent as older industries. The subject is a large one, and I shall refer only to one phase of it—cost accounting. Unless we have an accurate knowledge of costs, scientific merchandising is impossible. Inaccurate cost accounting is the real cause of most of the unfair competition that exists to-day. Let me illustrate what I mean by presenting a well-known condition in the electrical industry.

There are concerns whose activities include two or more of the factors between the manufacturer and the ultimate consumer. A light and power company may act as a distributer of electrical equipment; a jobber may do contracting work, and a contractor may be a wholesaler and a retailer of electrical devices. Serious objection has been raised to this practice on the ground that it promotes unfair competition. There are many who believe that each factor should be confined to its special function. I do not agree with this point of view. It is not economical to attempt to build artificial barriers in the channel of distribution. Unfair competition does not arise because the concern is operating more than one branch of the industry, but because it is not scientifically merchandising its goods or its brains, and the reason for failure to do so is faulty cost accounting. Costs are averaged with the result that a profitable branch of the business is often made to carry an unprofitable one. You recall the old saying, "Every tub should stand on its own bottom." This contains a sound ecomonic truth. The central station, for example, is not an undesirable factor in jobbing or contracting or retailing, provided it recognizes the factors of cost applying to these branches, and thus preventing its main business from being used to create destructive competition in other lines of the trade in which specialist concerns depend for their entire living. Every branch of a business should be treated as a separate unit in the determining of costs, and made to show a profit; otherwise it is working an injury to the trade as a whole from which it must itself suffer in time. Accurate cost accounting, scientific merchandising—on these depend the fullest development of our industry. As soon as they receive practical recognition, unfair competition will disappear. No concern can justly object to fair competition. If it cannot meet such competition the fault is in itself, and not in any extraneous condition.

Practical Co-operation.

The war has taught us many economic facts, and the necessity for practical co-operation is one, and perhaps the greatest. The government has recognized the necessity for holding in abeyance laws that obstruct legitimate co-operation, and this may be regarded as preliminary to their abolishment or amendment. In no time in our history has there been greater necessity for business men to co-operate in bringing about the scientific merchandising of our goods, our brains and our experience. The winning of the war and the future prosperity of our country depend upon it. This is one of the principal problems of the War Industries Board at the present time.

The Contractor An Essential Part of the Industry.

Therefore, for the development of each individual contractor's business, and for the furtherance of the nation's interest as a whole in the war, it is the duty of every contractor to consider himself an essential part of the great electrical industry, and endeavor to completely fulfill his functions. This involves not only running his own business at a profit—which is a fundamental obligation—but assisting the jobber and the manufacturer to run their business at a profit and to forward the industry as a whole.

Each must co-operate in local, State and national organizations as far as possible. The more the contractor regards the manufacturer and the jobber and central station as necessary parts of his business, the more they will regard him as a necessary part of theirs. Only by organized co-operation can the electrical contracting and merchandising business be built up to the strong position it must occupy in order to do its full part in the development in this country of the great electrical industry.

Electrical Contracting and Retailing

By J. E. Sweeney*

Just a few short years ago the average man got out of bed shivering on a dark, cold morning, lit a smelly kerosene lamp, hustled into his cold clothes, fussed around lighting a wood or coal fire, put on the kettle for coffee, shaving water and face and hand bath. Waited around for half or three-quarters of an hour for the fire to burn up and breakfast to be prepared. If he wished to go to the basement, closet or dark outbuilding he carried that smoking kerosene lamp, a flickering candle or a dim lantern. When ready to go to his work he walked four or five blocks to the horse-car line, with straw or hay on the floor as the heating apparatus, which carried him along in semi-darkness and full discomfort at the rate of possibly six or seven miles an hour.

If his office was above the ground floor he tramped up flight by flight of tiresome stairs. If he wished to communicate with any other person in the city he either walked out to see them or sent a message by the errand boy. All day long that man was dependent on direct manual service. On dark days he was at a loss for any suitable light; on a hot day he wielded a palm-leaf fan, swore at the heat, mopped perspiration from his brow and let it go at that, to the sacrifice of his comfort and efficiency.

In his office he wrote his own letters long-hand; if he wanted to add a column of figures he did it as he had done in school, and probably had it checked by a clerk who used the same method. Arriving home again at night, to communicate with a neighbor meant a visit, to summon a doctor in sickness meant possibly a dangerous delay. Everything that he did was in a way or by a method that we to-day, less than a generation later, would call most uneconomical and inefficient. His whole daily life, both commercial and domestic, was only a slight improvement in materials and methods over that of the savage.

What Electricity Has Done

Now let us see what electricity has wrought. In the electrically equipped home when Mr. Man retires at night he does so without a household worry. If a burglar tries to break into the house a gong sounds both inside and outside of the house, a light flashes in Mr. Burglar's face, sending h'm

*Before Waterloo Rotary Club

living-room. At the proper time in the morning an electrically-operated thermostat arranges things so that the temperature of the room will be just right, and upon arising he has light at the touch of a button. Breakfast also can be prepared at the touch of a button, and when he is ready to go to work he can telephone to the garage for his electric coupe or walk to the corner and board a bright, clean, electrically-heated, ventilated and well-lighted electric street car, and is whisked to his business in safety and comfort. Reaching his office building he climbs no stairs, but an electric elevator hoists him smoothly and quickly to the second or steenth floor, where his office is brightly lighted and cheerful. He has telephones, dictograph, adding machines and other electrically-operated appliances. All day long the electric current surrounds him and works for him; smooths his pathway in business and pleasure, saves him time, effort, energy and worry and increases his efficiency, lengthens his day, shortens his working hours and tirelessly works for his safety, comfort and convenience.

In the Factory

So much for the man in his office. Let us go out to the electrically-operated factories, where we will find electric motors directly connected to every known kind of a machine tool, increasing production and efficiency, and making better articles and more of them than was possible with the older methods, or with the same machine tools driven with other means of power. We also find proper lighting, reducing the possibility of accidents and making better working conditions for employees. In fact, every process that can be electrified is always handled in this manner.

The Home

And then coming back to the home again. In these days we find that you are giving your wife a square deal and full advantage is taken of the many labor-saving devices designed to make the work of the woman easier and more pleasant. Household appliances have been developed to such a point that with their assistance the work of the ordinary home can be accomplished without the aid of hired help and without the work being a burden to your wife. Such machines as electric washers, vacuum cleaners, electric irons, dish washers, toasters and percolators have been developed almost to perfection and should be placed at the disposal of the women in the home by all means. Take, for instance, a washing machine; I venture to say that if Mr. Hubby were to make an agreement with Friend Wife to do the washing turn about that it would work out something like this: there would be just three real regular wash days; she would do the first washing, Hubby would do the second washing, and Friend Wife would do the third, but when it came Hubby's turn again he would see to it that it was done electrically, and, in all probability, would arrange to have a number of other electrical devices put into the home, such as sewing machine motors, percolators, toasters, etc., if they were not there.

Low Cost of Operation

And then, too, let us consider the cost of operation of these remarkable conveniences. A washing machine is operated at an approximate cost of ¾ cent per hour; a sewing machine will run for about five hours for 1 cent; a 40-watt Mazda lamp, which gives approximately 40 c.p., costs 10 cents for 25 burning hours. Another remarkable feature is that in spite of the increasing cost of labor and materials no increase has been made, as yet, in the cost of electric service or Mazda lamps.

It's Up to the Contractor

Now comes the part that I am interested in as an electrical contractor and dealer. You should realize that the installation of electrical wiring and equipment in a modern building, whether it be factory, office or residence, is one of the most important elements in the satisfactory and comfortable use of that building. Provision should be made for all of the electrical conveniences of to-day and foresight used in providing for other devices that we know will be commercialized in the near future.

Telephones in Trains

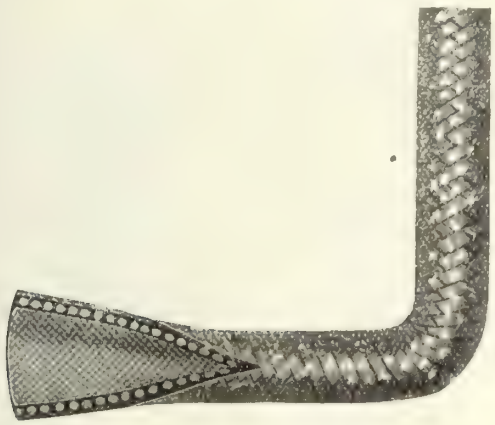
Reports have recently been made public of a successful test of telephone communication between a train despatcher's office and a moving train, made by the Canadian Government between Moncton and Humphries' Station in New Brunswick. It is stated that communication was easily established between the despatcher and the conductor when the train was moving at a rapid rate; also that the conductor in one part of the train was able to communicate satisfactorily with the engineer, who filled orders to disconnect his engine, proceed forward, stop, return, recouple, back the train onto a switch and perform other operations without any other means of communication. There seems little reason to doubt that it is merely a matter of time when sufficient refinements will have been made in this phase of telephone equipment to permit passengers in transit to place themselves in communication, for business or social purposes, with friends and acquaintances many miles away.

New Hydro Development in Port Arthur District

Sir Adam Beck, Chairman of the Hydro-electric Power Commission of Ontario, has announced the probability of another hydro-electric power development in the neighborhood of Port Arthur on the Nipigon River. On this river there are two sites with a combined possibility of approximately 70,000 h.p. each. At one of these points—the one it is proposed to develop first—there are two main falls within a short distance of each other, with a combined head of 105 feet. One of these falls alone, it is calculated, would give about 30,000 h.p. under a head of something over 50 feet. The Commission's engineers have not yet determined just what plan will be pursued, but present indications are that the first development will be planned to include the whole head of 105 feet for an ultimate capacity of 75,000 h.p. An order-in-council has already been passed for an initial development of 30,000 h.p. This will probably require four units and the expenditure authorized for this development is $4,500,000.

This site is about 65 miles from Port Arthur, which city will be connected with the power site by a 110,000 volt transmission line. The Canadian Northern Railway runs within a few hundred feet of it so the development work will be greatly facilitated.

Re-establishing Cripples

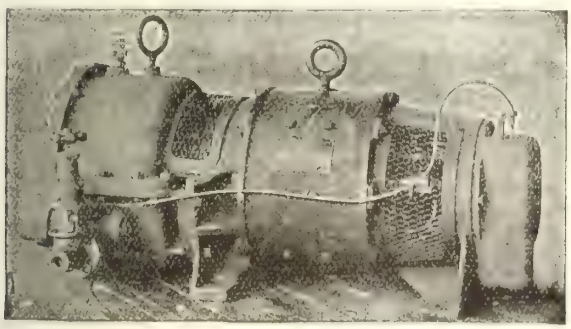


Much has been said regarding the plans of the Dominion Government to help war cripples secure remunerative employment in spite of even the most serious wounds or other injuries, but comparatively few people have seen actual evidence of the miracles being wrought for the men by specialized vocational training and physical reconstruction. At the Canadian National Exhibition some fifty men who have been restored to full usefulness, will demonstrate how the soldier beneficiaries of the government's rehabilitation programme have been made economically self-supporting. Included will be a number of blind men, who have been re-educated and are back on the civic payroll. These men will demonstrate at least 15 industrial processes, including typesetting, oxy-acetylene welding, jewelry manufacture, lens grinding, assaying, etc.

A newspaper report states that the Marconi Company will shortly erect the world's largest wireless station near Buenos Aires. Three towers, each the size of the Eiffel tower, are to be erected.

What is New in Electrical Equipment

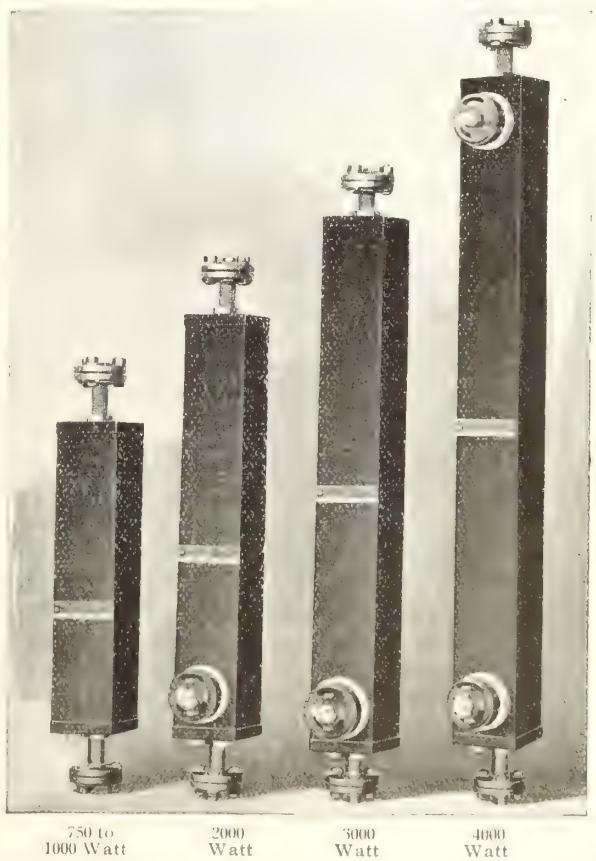
Kraft Cord "Braiduct"



The Flexible Conduit Company, Limited, of Guelph, Ont., have placed on the market an addition to their lines of flexible conduits, under the name of Kraft Cord "Braiduct." A new feature is that the Kraft Cord is fireproofed and made to special specifications prepared by the company. The insulating compounds used are made in the company's own plant

and the product is uniform in flexibility. Every foot is fished by an automatic fishing device invented by themselves. The company further state that Kraft Cord "Braiduct" is regularly inspected and labelled by the Underwriters' Laboratory, under the direction of the National Board of Fire Underwriters, and every coil carries the Underwriters' label.

Westinghouse Brings Out Small Turbo-Generator Unit.



The Westinghouse Electric & Manufacturing Company has recently produced a small turbo-generator unit for direct-current service. This unit is designed for 10 kilowatts output, although a temporary load of approximately 12.5 kw. may be obtained. The most important feature of this unit is that it is but one revolving element in which the generator shaft is extended so that it also carries the turbine rotor. This not only makes a very compact machine, but

eliminates all coupling and misalignment troubles, and dispenses with turbine bearings and packings. The turbine rotor is made of a high grade open hearth steel forging accurately finished, in the periphery of which are placed blades of electric furnace steel which are held in place by pins tightly driven in through blade and rotor. The blades are of the impulse type and although there is only one row of blades yet by means of a reversing chamber the same steam is passed through the blades a second time, thus allowing complete expansion of the steam. Since the unit is designed to occupy the least possible space, the manufacturer has equipped the generator with ball bearings (no bearings being required on the turbine instead of the usual type of surface bearing; thus saving in bearing friction with a consequent decrease in length and weight of the unit is effected. Moreover these self-aligning ball bearings on small units are suited for a variety of services, particularly for marine work which often times compels the unit to operate at an angle due to the position of the ship.

New Hughes Water Heaters

The Hughes Electric Heating Company have placed a new type of water heater on the market in various capacities, as shown in the accompanying illustration. These heaters are made in sizes 500, 750, 1,000, 1,500, 2,000, 3,000 and 4,000 watts. Larger sizes are made to order. In capacities less

than 1,000 watts only single heat switches are supplied; from 1,000 to 3,000 single, two or three heat; 4,000 and over, six heat. These heaters are manufactured with a very special insulation and are claimed to be very efficient. The fact that some 700 of them have been sold within the last six months appears to bear out this claim. They are manufactured for either 110 or 220 volts.

Two linemen were severely shocked in St. Thomas recently while cutting and trimming trees. A large limb fell on a high tension wire, short circuiting the street lighting system. Considerable damage was caused in the power-house and to smaller wires throughout the city.

Wiremold Catalogues

Canadian Company, Limited, have issued an attractive Wiremold catalogue with installation suggestions. This company are sole Canadian distributors for Wiremold, and in this booklet point out the economical possibilities of its use. It is stated that 1,500 feet of Wiremold, as compared with an equal quantity of ½ inch conduit, saves a ton of steel—no small consideration at this time, when so much of the latter commodity is required for war purposes. The catalogue is divided into three sections: section I. describes the various fittings and their method of installation; section II. contains some notes on bending Wiremold, passing around beams, tapping, etc.; section III. illustrates a number of typical Wiremold installations in homes, stores, offices and factories. The company have also ready for distribution a couple of attractive booklets, "Wiremold in Your Business" and "Wiremold in Your Home." In these booklets actual installations are portrayed showing the many uses to which Wiremold may be put and the resulting conveniences.

The fare on the B. C. E. R. in Vancouver is now six tickets for 35 cents, or six cents straight. No money is to be deposited in fare box—single tickets must be purchased from the conductor and placed in the box by the passenger. To relieve the shortage of coppers the company have issued one-cent coupons which are accepted as cash by conductors or redeemed at the head office.

Personal

Mr. Arthur Parent, superintendent of lighting for the city of Montreal, has been appointed a deputy director of the civic Public Works Department, with charge of the lighting, parks and ferries, incineration, and municipal buildings.

Dr. Alfred Stanfield, for many years professor of metallurgy at McGill University, has been in British Columbia for some time investigating the possibility of the electrical smelting of iron ores in that province. The investigation is being undertaken on behalf of the Department of Mines.

Mr. C. H. Tillett has been appointed electrical engineer of the Grand Trunk Railway, in succession to Mr. J. A. Burnett, who has been appointed technical assistant with the British War Mission, Washington. Mr. J. J. Ginty succeeds Mr. Tillett as supervisor of signals, eastern lines.

Major William Thomas Wilson, R. E., A.M.E.I.C., has been awarded the Military Cross. Major Wilson was formerly a member of the engineering staff of the Montreal Light, Heat & Power Company, and later manager of the Dorchester Electric Company, Quebec, now controlled by the Shawinigan Water & Power Company. He joined the overseas forces in 1915, and was afterwards transferred in France to the Imperial Forces, being promoted to captain, and in 1916 to major. He has been twice mentioned in despatches.

Mr. M. C. Gilman, for several years with the Toronto Electric Light Company, latterly as sales manager, has resigned to become manager of Willis L. Adams' Montreal office, at 501 Power Building, who handle the sale of Packard transformers and meters; Thomson spot, butt and seam welders; Majestic electric heaters; a line of motors and arc welders; and "oil gas" furnaces in Canada east of the C.P.R. line Kingston to Renfrew. In addition to his regular work with the Toronto Electric Light Company, Mr. Gilman has been particularly active in association work. Latterly he has been secretary of the Canadian Electrical Association, in addition to which his name has always been in evidence on committees. Some of the most valuable committee reports presented before the Association in recent years have been largely due to Mr. Gilman.

Vancouver Convention

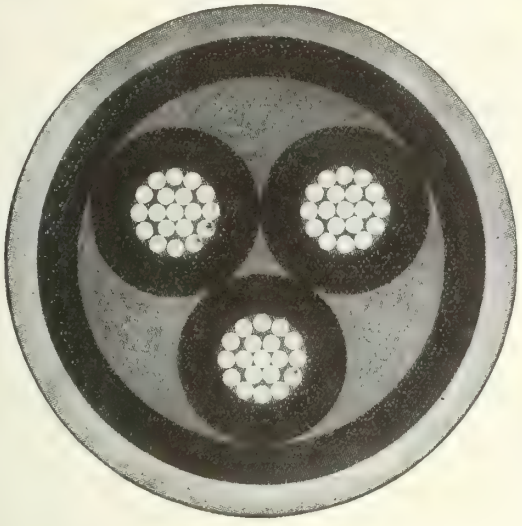
The second annual meeting of the British Columbia Association of Electrical Contractors and Dealers will be held at Victoria on Friday and Saturday, August 16-17, and will include banquets and a picnic, in addition to the regular business. It is felt by the officers of the Association that this will be the greatest meeting of electrical men ever held in Western Canada, and a cordial invitation is extended to the electrical trade everywhere to be on hand, if at all possible. It is announced that Albert Elliot, of San Francisco, will be present to address the gathering. Further information and particulars regarding the convention may be secured from the secretary, Captain W. J. Conway, 406 Yorkshire Building, Vancouver.

The British Columbia Electric Railway Company, Vancouver, B.C., have outlined a tentative proposal to the city to operate their system on a "carry for cost" basis, the company requiring only a reasonable interest on the capital value of the plant and facilities used, to be established by valuation.

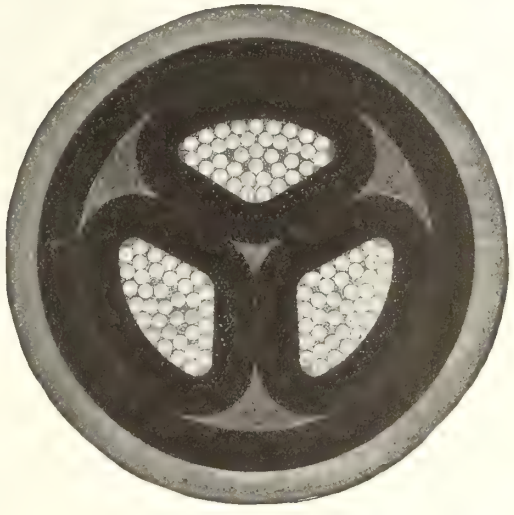
At a meeting of the ratepayers of Mount Dennis, Ont., recently, it was decided to enter negotiations with the Hydro-electric Power Commission for a supply of power for the town. It was pointed out, as an argument in favor, that the town of Woodbridge, where the installation was only four years old, was now entirely out of debt.

Trade Publications

C.G.E. Publications—Type IL series transformers for street lighting service. This is a transformer designed to operate single 15-20 amp Mazda series lamps, the current being stepped up from standard 6.6 or 7.5 amp. The dimensions are such that the transformer may be comfortably housed in the post of the lamp-pole, or, if necessary, may be placed underground near the lamp-pole. Other publications include a folder describing CR 3204 drum type controllers for slip-ring induction motors, and folder CR 2820-797 time element overload relay.



Electrical Catalogue No. 45E, by Nerlich & Company, Toronto, contains descriptions and illustrations of fixtures, portables, glassware, brass parts, supplies, flashlights and appliances carried by the company.



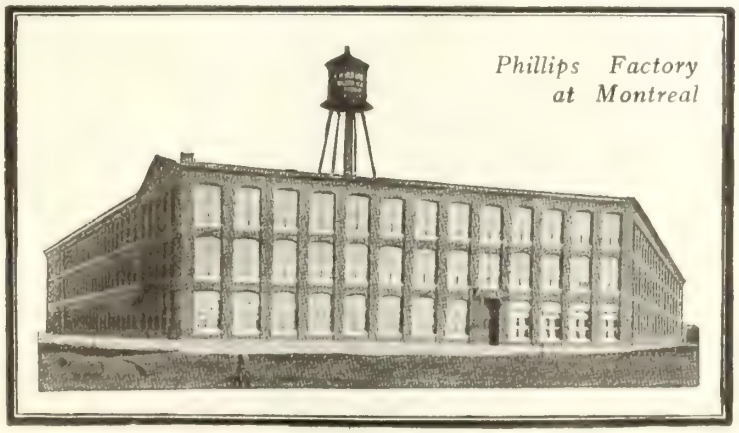
One of a large number of attractive table lamps shown in Nerlich's handsome new catalogue noted above.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Current News and Notes

Brantford, Ont.

The Brantford Municipal Railway Commissioners have decided to eliminate the eight-for-a-quarter limited tickets, retaining the six for a quarter tickets which may be used at any time. There will be no further changes at present, the cash fare remaining at 5 cents. On the Grand Valley Railway, however, fares have been raised from 30 cents to 35 cents.

Hull, Que.

An increase in the passenger and freight rates on the Hull Electric Railway Company's lines to Aylmer and intermediate points has been allowed by the Board of Railway Commissioners. Passenger rates are to be increased approximately 15 per cent. and freight rates will vary in increase according to the commodity transported.

Kingston, Ont.

For the first time in its history the Camden Independent Telephone Company is unable to pay a dividend. It is thought that the recent increases in the price of material and labor will necessitate a higher rental.

Montreal, Que.

A. A. Giddings & Company, Limited, have been granted letters patent to carry on a general electrical business. Head office is to be in Montreal, and capital stock $50,000. The present business of A. A. Giddings & Company is to be taken over.

La Compagnie d'Ouvrages Artistiques en Cuivre, Ltd., has been formed with a capital stock of $49,000, to manufacture electroliers, light fixtures and electric heating apparatus, electric clocks, and other electrical supplies. The principal place of business is Montreal.

The Globe Electric Company of Canada, Limited, Montreal, have been granted a Dominion charter.

Newcastle, N.B.

The city council of Newcastle, N.B., have under consideration the expenditure of $125,000 on an electric plant. It is proposed to generate power on the Sevogle River, 26 miles from the town, and a report on the feasibility of such a plan is now being prepared.

Rainy River, Ont.

The Rainy River Electric Light & Power Company have completed arrangements to sell their property to the municipality. The latter will take possession in the course of the next few weeks. Mr. W. H. Green, manager of the Rainy River company is, fortunately, retaining his position with the municipality.

Regina, Sask.

The Great Western Electric Company, Limited, Regina, have made application to change the name of their company to the Midland Electric Company, Limited.

St. Catharines, Ont.

The financial report of the St. Catharines light and power department for the month of June showed earnings of $11,743; expenses $9,035; gross surplus $2,708, and net surplus $1,708. There are 3,270 consumers and a steady increase in business.

Scarboro Township, Ont.

The power lines of the Ontario Hydro-electric Commission, being constructed through Scarboro township, are practically completed and current will soon be available in Agincourt.

Sorel, Que.

The Sorel Electric Light & Power Company, Sorel, Que., are changing their system from 30 to 60 cyles and their transmission voltage from 11,000 to 20,000 volts. The change-over includes installing automatic induction regulators on all feeders, changing the town distribution from 2,300 volts, 3 wire, to 4000 volts, 4 wire, and the building of new sub-stations and installation of synchronous condensers.

St. Hyacinthe, Que.

Millette & Company, electricians, St. Hyachinthe, Que., have registered.

Teeswater, Ont.

The ratepayers of Teeswater, Ont., voted July 15, on the question of purchasing the privately owned electric plant and operating it as a municipal system.

Toronto, Ont.

The Hydro-electric Power Commission have granted the city of Toronto a rebate of $1 for each street light discontinued under the conservation of electricity scheme, and it is estimated this will mean a saving of $44,000 yearly for the taxpayers.

The Leaside Munitions Company, Toronto, have applied to the Hydro commissioners for a supply of 2,500 horsepower.

The Toronto Hydro-electric commissioners have under consideration a supply of power for the new Union Station.

Walkerville, Ont.

The net surplus of the Walkerville municipal light and power department for the last financial year amounted to $10,386, an increase of approximately 100 per cent. over the previous year. Earnings during the past year totalled $152,162 as compared with $112,465 the previous year.

White Rock, B.C.

The Corporation of the District of Surrey, Cloverdale, B.C., have commenced the installation of 20 street lights at White Rock, having signed an agreement with the British Columbia Electric Company to furnish current for seven years.

Produce and Save

The management of the Canadian National Exhibition have distributed this year a poster entitled, "Produce and Save." Production is impersonated by a young maiden, "Agriculture," who is shown with a graceful, powerful stride scattering the grain broadcast over the prepared land. In the background are shown the exhibition buildings, as typical of the time and place where we are taught how best both to produce and to save. The paster draws attention to the date of the exhibition, August 26 to September 7, inclusive, and, briefly, to the most prominent features, which include 1,200 performers, a spectacle of courage and faith in "Britannia Militant," the usual varied and complete exhibits of farm products—live stock, and an unusual display of tractors and other man-power-saving devices. In view of the importance of agriculture in winning the war, our national exhibition should attract more than ordinary attention this year.

The Hydraulic Power Company, Niagara Falls, N.Y., are working on an addition to their present plant, which will have an ultimate capacity of 330,000 horsepower. This will be made up of 10 units of 33,000 h.p. capacity each. The immediately present installation calls for two such units and these, it is expected, will be in operation this autumn.

Steam Engines for Immediate Sale

suitable for general mill work, power transmission by belt, rope drive or spur gearing, for driving wood working, grinding, crushing, or hoisting machinery, or air compressors, in factories, saw mills, pulp and paper mills, ship yards, munition works, mines, grain elevators, etc.

2 300 h.p. vertical cross compound, 4 valve engines with shaft governors, cylinders, 18 and 24 x 24 in., 150 r.p.m., with surface condensing equipment for each engine.

1 300 h.p. vertical cross compound, 4 valve engine with shaft governor, cylinders, 20 and 38 x 24 in., 150 r.p.m., without condenser.

2 600 h.p. horizontal cross compound, Corliss Engines, 18 and 34 x 42 in. cylinders, 100 r.p.m., with separate surface condensing equipment for each engine.

1 1200 h.p. cross compound Corliss engine, cylinders, 26 and 52 x 48 in., 85 r.p.m., with surface condensing equipment.

2 1200 cross compound Wheelock gridiron valve engines, cylinders 27 and 52 x 46 in., 90 r.p.m. One surface condensing equipment for the 2 engines.

These engines now have electrical generators mounted upon them which the present owner wishes to keep. Generators to be removed from engine shafts and engines sold without them.

These engines could be fitted with new drive wheels for either belt or rope driving, or with spur gearing, making them available for any kind of factory duty.

The 1200 h.p. Corliss engine is an especially heavy machine. All of them have been operated at 135 pounds steam pressure and about 25 inches vacuum.

There is also one 250 h.p. Wheelock type, cross compound engine, cylinders 16 & 27 x 40 in. with belt type flywheel and surface condenser.

These engines are to be sold as they stand. Overhead hand traveling cranes in place available for dismantling.

Purchaser to make his own inspection, to have access to all available records, and to remove engines and condensing equipment at his own expense. The air and circulating pumps to accompany the condensers.

If prompt possession of any or all of these engines is desired, time will be saved by the Purchaser sending his representative here without delay.

Correspondence is desired only with parties who have immediate use for any or all of these engines.

BOILERS

For Immediate Sale

Suitable for ship yards, munition works, mines, mills, elevators, electric power stations, etc.

5450 H.P. of B & W Stationary Boilers

with forged steel headers, and superheaters, in the following sizes:

2—450 h.p. Boilers, 16 wide 12 high, 2—48 in. drums each, installed 1902.
3 590 h.p. Boilers, 21 wide 14 high, 3—42 in. drums each, installed 1905.
3 390 h.p. Boilers, 16 wide 12 high, 2—42 in. drums each, installed 1910.
1 580 h.p. Boiler, 24 wide 12 high, 3—42 in. drums, installed 1910.
2—515 h.p. Boilers, 21 wide 12 high, 3—42 in. drums each, installed 1910.

Eight of these 11 Boilers are now allowed 150 pounds steam and 3 are allowed 135 pounds. All are in operative condition.

If it is desired to add to the capacity of any modern boiler plant carrying 200 pounds pressure for supplying steam turbines, these boilers can be easily adapted to 200 pounds pressure by being fitted with new drums.

To be sold as they now stand, including grates and the usual boiler connections and fittings attached to them. Purchaser to make his own inspection, to have access to all available records in Owner's possession, and to remove Boilers at his own expense.

If prompt possession of any or all of these Boilers is desired, time will be saved by Purchaser sending his representative here without delay.

Correspondence desired only with parties who have immediate use for any or all of the Boilers.

Upright closed type feed water heaters, and boiler feed pumps belonging to this plant are also for sale.

2—30 KW., 125 volt, West., 1140 R.P.M., D.C. Generator, direct connected to one 3 phase, 60 cycle, 220/440 Ind. motor.

ROTARY CONVERTERS

2—200 KW., 3 phase, 25 cycle, 600 volt, D.C., primary, 13200/1180 volt.

1—500 KW., 550 volt, D.C., West., 3 phase, 25 cycle, with 3 suitable S.P. Transformers, 13200 volt P. and 390 volt S.

4—500 KW., 600 volt, D.C., Rotary Converters, 3 phase, 25 cycle, with suitable transformers; 6600/5940 volt P., 430-286-143 volt S.

1—300 KW., 575 volt, D.C., 370 volt, A.C., 600 R.P.M., complete with three 185 K.V.A., 60 cycle transformers, 2200 volt P., 370 volt S.

STEAM TURBINES

2—400 KW., West., 3600 R.P.M., 160 lb. Steam, 2300 volt, 3 phase, 60 cycle, complete.

1—1500 KW., G.E., Curtis, 3 phase, 60 cycle, 2300 volt, 3600 R.P.M. Complete.

1—500 KW., Allis-Chalmers, 2200 volt, 3 phase, 60 cycle, 3600 R.P.M, complete.

1—1000 KW., Allis-Chalmers, 600 volt, 3 phase, 60 cycle, complete with condensers.

HYDRO ELECTRIC UNITS

2—Hydro Electric units, each consisting of one 1200 H.P. double bronze runner, horizontal cylindrical Leffell Turbines, complete with Governors and Draft Tubes. Direct connected to each of these units are two 437 K.V.A., 3 phase, 60 cycle, 4400 volt, 300 R.P.M., G.E. Generators. Equipment is complete with Switchboard, Oil Switches, Instrument Transformers, etc. Equipment practically new.

1—Hydro Electric unit, 1200 H.P., as above, with one 875 K.V.A., G.E. direct connected unit.

PUMPS AND COMPRESSORS

1—1,000 gal. Underwriter Fire Pump.

1—800 ft., 30 lbs., Vertical Air Compressor.

1—600 ft., 30 lbs. Horizontal Air Compressor.

1—200 H.P., Worthington, 2 stage, 12-inch Turbine Pump, rated capacity 4000 G.P.M., at 60 lbs. pressure, direct connected to one 100 H.P., 3 phase, 60 cycle, 440 volt, 575 R.P.M., Westinghouse Induction Motor, complete with auto starter and no-voltage release.

1—1160 ft. Sullivan two stage belt driven air compressor complete.

1—1586 ft. Sullivan two stage belt driven air compressor, complete.

MISCELLANEOUS

2—Light Freight Car Trucks, splendid condition.

1—10-ton, 4 wheel double block steam locomotive, construction crane.

1—50 H.P. Foss Gas Engine, speed 200 R.P.M., one cylinder; flywheel 4 ft. x 12 in. Used only three weeks.

We also handle a full line of Electric Railway Equipment and Supplies

Our stock changes daily and above list is only a small proportion of what we have. For further particulars wire, telephone, or write. Let us solve your problems. All engineering service without obligation. We advertise and sell your released equipment without cost to you.

Reaching Your Customers

THE logical place and time to talk to your customers is in the Electrical News when they are thinking of things electrical.

If your product is bought by electrical men, advertising in the Electrical News will carry your message to them.

You and your wares may be favorably and nationally known to-day but if you don't advertise you will soon be forgotten.

Manufacturers of High and Low Tension Porcelain Insulators

Hydro Electric Equipment For Sale

3—350 KVA., 2300 volt, 3 phase, 60 cycle, 360 r.p.m., rotating field Vertical A.C. generators with two guide bearings but no thrust bearings, 40-degree continuous operation, 25 per cent overload for 24 hours, 50 degree rise.

3—15 K.W., 125 volt, 360 r.p.m., 4 poles, No. 10 SV frame, type "S" D.C. generators, vertical type, for excitation of above A.C. machines.

1—Four-panel switchboard with Tirrill regulator for control of above three A.C. generators and one feeder circuit. All of the above electrical machinery is of Westinghouse manufacture.

3—Trump pattern water turbines, vertical type, of 454 H.P., each under not less than 50 feet head, at that head using 6,000 cubic feet of water per minute, with an efficiency of 80 per cent. Also 3 cast iron heads with trash racks, 3 sections of 50 in.—¼ in. steel pipe between turbines and gate valve, 3 sections 50 in.—¼ in. steel pipe between trash rack and gate valve. 3—draft tubes 5 ft. long and 48 in. diameter.

3—Woodward Compensating governors for water turbines.

3—50 in. gate valves with bronze screw, nut, bronze seat and bronze face on valve where it comes in contact with seat, equipped with by-pass valve.

These turbine wheels and connections manufactured by the Pratt Iron Works, Akron, Ohio :: ::

(Continued on page 81)

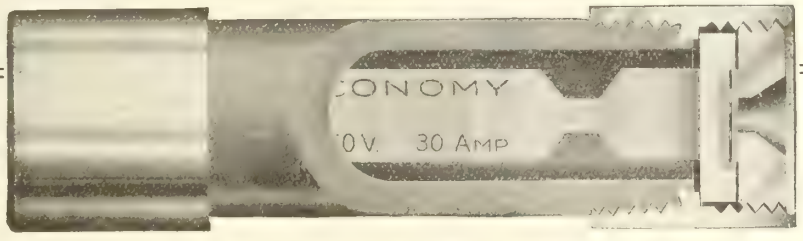
You Know the Noise!

caused by commutators sparking and flashing—the result of undue friction between brushes. This trouble can be cured by fitting your machines with

No-Spark Carbon Brushes

They run smooth, do away with the continual cleaning, replacing and resetting because these brushes are frictionless and self-lubricating. Try "NO SPARK" Brushes. Other engineers are enthusiastic over them. Why not you?

CALEBAUGH
Self-Lubricating Carbon Co.
1503 Columbia Ave., PHILADELPHIA, Pa.



We Have Power To Sell—

continuous, dependable, ever-ready power. When you buy a Wagner Motor you are not getting only so much iron, copper and insulation. You are getting a power unit that will serve you under the most adverse conditions and for years to come.

Wagner Quality

And that is what you want. It is the Quality in Wagner Motors that makes them more than worth the preference you pay. Are you getting QUALITY-power when you buy motors? Let us send Bulletins 11013 and 11113.

GROWTH—

Day after day, week after week, month after month, for the five years that Economy Fuses have been on the market, the sales have maintained a constant growth—not alone in volume, but also in percentage of increase. This is because

ECONOMY Renewable FUSES

are absolutely accurate in operation and cut annual fuse maintenance costs 80%. An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

OXY-ACETYLENE WELDING & CUTTING

Boiler Section reclaimed by Oxy-Acetylene Welding

A National Necessity

Now that a maximum production and 100 per cent. efficiency are vitally important, the utilization of the Oxy-Acetylene Process is imperative in all industries upon whose production the future of Canada depends.

Tens of thousands of dollars are being saved daily by the reclamation of broken machinery and other discarded material by Oxy-Acetylene Welding, and its use gives greater strength and durability with freedom from future trouble in the joining of metals for all industrial purposes.

L'Air Liquide Society

The Pioneers of the Process throughout the world.

Protected Disconection Terminal.

IF you are a user of cable terminals you should have a copy of our bulletin on Outdoor Cable Terminals (Type D.O.A.) In addition to terminals for ordinary light, power and railway service the following types for special uses are described:

Pipe Top Terminals
Protected Disconnection Terminals
Borehole Terminals
Small Telegraph or Pressure Wire Terminals
Third Rail Terminals
Mine Shaft Inverted Terminals

There are also complete tables of dimensions, weights, etc., and instructions for ordering and installing which should be in the files of all terminal users. Write our nearest office for your copy.

Moloney Service Transformers

are all supplied with brass plates fastened on the inside of the cover of each transformer; all connections marked plainly. They do not get covered with dirt or stained with oil like a blue print does. You always have them before you when changing taps. Heavy bushings eliminate breakages in shipment and handling

Moloney Transformers are manufactured in a factory that was built especially for that purpose only. They are designed by Engineers and built by men who make a specialty of this work.

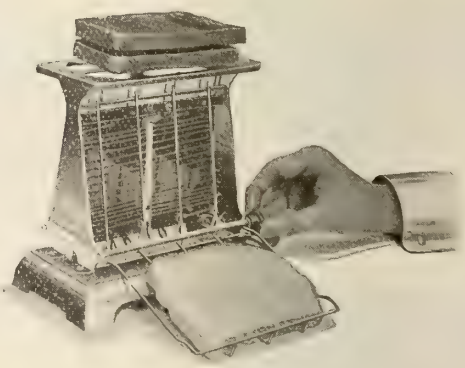
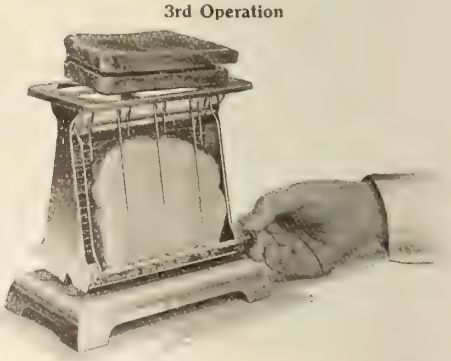
Westinghouse

Electric Irons and Turnover Toasters





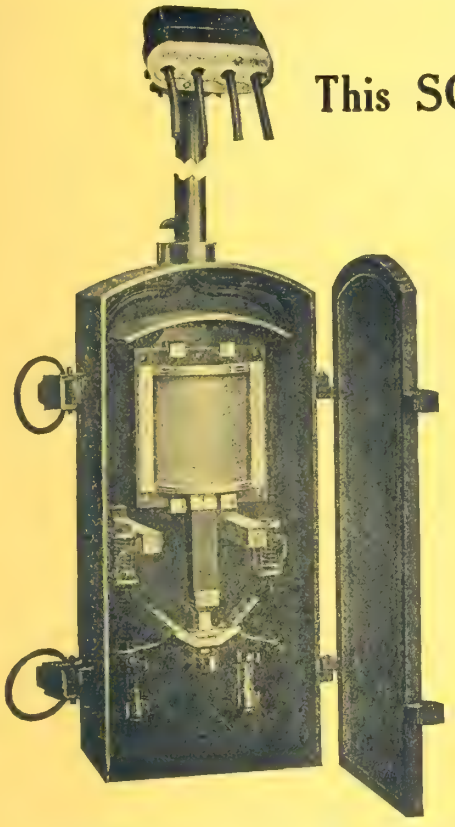
1st Operation

2nd Operation

3rd Operation

4th Operation

Two Profitable Leaders



The Iron is practically indestructible, has no delicate pieces. All heat is given off at the ironing surface. Radiation from top is prevented by a dead-air space. A heat storage plate stores the heat, making it stay hot longer.

The Turnover Toaster besides turning the toast without danger of burning the fingers, acts also as a hot plate for keeping the toast, plates or coffee pot hot, etc.

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment, by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Safeguard Your Lighting System

The Knife Switches used on the ordinary panel board are dangerous. Protect your employees by using—

Krantz Safety Panel Boards

The lights can be turned on and off without the slightest possibility of contact with live parts. The fuses are locked beneath the second door, and are reached only by authorized persons.

Besides being safe, these boards are very handsome in appearance and are an ornament to the building not an eyesore.

Send for complete descriptive catalogue.

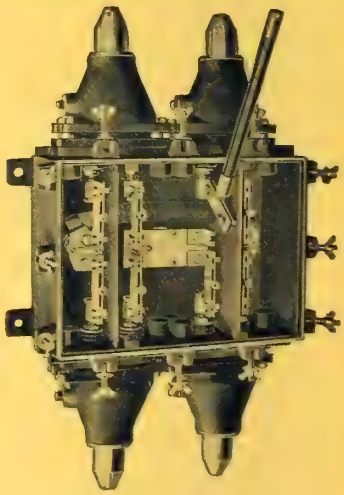
G&W ELECTRIC SPECIALTIES

The Essential Details of G & W DISTRIBUTION BOXES

are very carefully perfected

In the primary box illustrated, switch blade action is combined with bolted contact efficiency



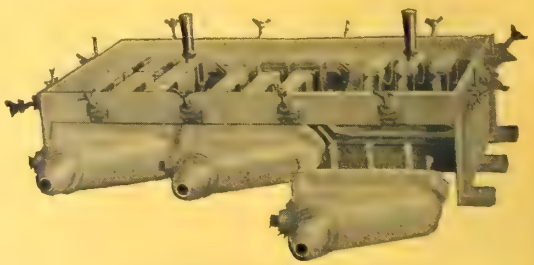
Unit cable potheads with ample compound space make an easy installation without sacrifice of safe, permanent cable end insulation.

The entire box is lined with insulating material—all bolt heads, etc., are covered and different polarities are thoroughly barriered.

In the secondary box double U clips give better contact alignment than would a single U clip.

The unit cable potheads attach at an angle, gaining roominess without using excessive wall space.

The line of this material is complete, offering constructions suitable for all conditions.



Primary Box for 2300 Volt Use

Make your plans now for the Convenience Outlet Campaign

Wire For Service As Well As Light

A Business Building Plan for Contractors

CONTRACTORS who include in their plans lighting outlets **only**, are losing an opportunity to build prestige and attract business. By installing outlets for appliances as well as for lamps, contractors give increased satisfaction to patrons as well as earn the good-will and co-operation of central stations.

Benjamin

Current Tap Sockets

help electrical contractors render this two-fold service.

This 2-in-1 socket has the appearance of an ordinary socket. But in addition, it has a receptacle for an attachment plug which is furnished with the device. It wins the users' appreciation by giving double the convenience of the usual socket. And it wins the support of central stations because it creates a market for electrical devices and helps the off-peak load.

Get the full facts about the Benjamin Current Tap Socket and other Benjamin prestige and business building electrical equipment.

PRODUCTS OF CANADA

Absorbs the Shock

Our special C. & H. Poly-Phase Meter is safe because it is fitted with new double terminal blocks that absorb the shock and reduce the danger of accident resulting from overloaded wires and from surge conditions during lightning storms.

This meter also has more inside room for the connections, and the three or four lines are carried straight through the meter from the left to right. In every respect this C. & H. Poly-Phase is a Safety Meter, and is undoubtedly the one to select for Installation on Long Distance Transmission.

C&H Poly-Phase The Safety Meter

The Company's guarantee goes with every instrument. The new Poly-Phase is as near perfect as it is possible for a meter to be.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

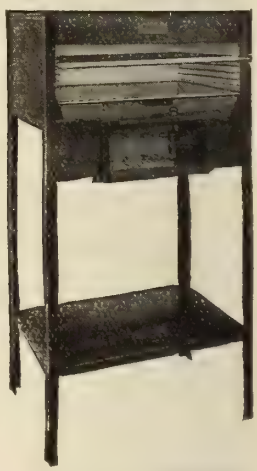
NEUCO
Electric Ranges and Broilers
For Hotels, Restaurants, Clubs, Factories, Hospitals, Mess Kitchens

There is no place where electric cooking has been more successful than in large kitchens. Modern hotels and restaurants are fast replacing coal and gas equipment with this substantial apparatus and large schools and hospitals are profiting through their installation.

The Neuco way of cooking means better cooking. Emile Bailly, the famous chef at the St. Regis Hotel, New York City, in speaking of the Neuco electric cooking appliances installed there, said, "This range helps to make the St. Regis cooking distinctive in quality and flavor." This statement is conclusive evidence that Neuco results are perfect.

NEUCO ELECTRIC HOTEL RANGE

Neuco hotel ranges are heavily built to stand the severe usage of commercial cooking. They are compact and convenient, fit back to back and side by side to make any suitable arrangement of units. Additional units may be installed at any time to increase the capacity of the installation.



The Range shown is not only a strong and practical electric range, but its outward appearance is very attractive. The drop doors are protected by spring balances with positive catch, the wrought iron being re-inforced at all joints and hinges.

It is a complete range in itself. Additional units may be placed side by side or back to back to meet the requirements of any size kitchen.

In the broiling of meats, fish and birds, Neuco broilers are fast replacing other means. The perfect cleanliness of the operation, the saving of fats for other uses, the convenience and speed with which the work is done, are factors in Neuco success.

The meat is supported horizontally and the juices are retained. Vertical support of broiling meats allows the juices to drip off, leaving the meat dry and tasteless.

Control of temperature is effected by a single switch. Each unit is fused.

WHITE'S PORCELAIN STRAIN INSULATORS

You want strain insulators that are strong physically, that stand up under the exceptional conditions of the heavy storm; that hold up under a load of sleet; that don't crack when the thunder rolls, the lightning flashes, and the wind whistles.

This is the kind of strains T. C. White Company is making of porcelain in a variety of sizes for different loads, and several designs for varying conditions.

It will pay you to write for bulletin which shows designs and gives the complete data on strain and electrical tests.

Write today.

Moloney Service Transformers

are all supplied with brass plates fastened on the inside of the cover of each transformer; all connections marked plainly. They do not get covered with dirt or stained with oil like a blue print does. You always have them before you when changing taps. Heavy bushings eliminate breakages in shipment and handling

Moloney Transformers are manufactured in a factory that was built especially for that purpose only. They are designed by Engineers and built by men who make a specialty of this work.

NEATLY CONCEALS ALL SURFACE WIRING

WIREMOLD

The Great Lighting Economy

Wiremold is what the electric lighting world has been seeking: a convenient, safe and economical means of conveying.

Light to Any Desired Spot

Wiremold is wanted in the home, office and factory. It is the essence of lighting convenience and its saving of current is the logical answer to the demand for

Power Conservation

Whether to a bedside, table or standard lamp, to an electric washing machine, iron toaster, vacuum cleaner; whether to the desk, shelf, cupboard, bench or counter, Wiremold conveys the light—right there.

It does not mar the buildings it serves. It beautifies them and its ingeniously arranged extensions can be connected by anyone.

Figure for a moment on the wide field of possibilities Wiremold as a sales maker opens up for you. This field is illimitable. Not only has the use of Wiremold become essential, but it carries with it the introduction to all the electrical goods you stock.

Let This Special Trial Order Lot Convince You

It has been arranged for your first order and contains 100 feet of WIREMOLD and a unit package of each of the 15 fittings—all that is necessary for any average job. The special lot will be forwarded to you on receipt of your cheque for $24.96.

Associate your business with Wiremold. Get it in front of your customers and you will reap a harvest of sales from a lighting improvement that every consumer will and must recognize as a necessity. We have abundant advertising literature to assist you. Make full use of it, and GET THE TRIAL ORDER WITHOUT DELAY.

The books shown here will prove valuable to you by their useful information, and illustrated use of Wiremold. They, with other forms of advertising literature, have told the simple story of Wiremold to tens of thousands. A postal brings them by return.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the **Underwriters' Laboratory** under the direction of the **National Board of Fire Underwriters** and every coil carries their label.

We will be glad to send you a sample.

Her Good Will is Your Best Sales Help

Every woman who is getting satisfactory service from her fan, suction sweeper, washing machine and heating devices, becomes a very effective sales aid for the electrical dealer, contractor and central station,

This is especially true to-day when household servants are difficult to obtain and women are making greater use of electrical aids to replace them. The woman who is getting reliable service from her electrical household helps is always an enthusiastic booster for them when discussing the housework problem with her friends. Electrical Dealers and Central Stations find that it pays big to make sure that their customers buy those devices which are absolutely dependable and which earn the goodwill of every user.

Devices equipped with R & M Motors can always be depended upon to give service which makes satisfied customers and brings orders from the customer's friends. And they have the additional advantage that the R & M Motor is advertised dominantly in the leading magazines. Its reliability is known to practically every prospective user of motor-driven devices. Leading household devices of all kinds can be obtained with R & M Motor equipment.

Vol. 27 Toronto, August 15, 1918 No. 16

Heavy Depreciation and Low Labor Efficiency

Particulars of the large depreciation in the value of obsolete cars were given by Mr. David E. Blair, C. E., the superintendent of the Montreal Tramways Company, during the hearing of the appeals to the Quebec Public Utilities Commission against the proposed increased fares. The Tramways Commission has issued a schedule of fares, the main feature being a 5c fare with 1c transfer; against this the City of Montreal and others apepaled, while the Tramways Company on its part asked for a 7c fare with free transfers. The Company submitted a mass of information to show that it would be impossible to run the cars at a profit unless this increase was granted.

Mr. Blair told of how the efficiency of labor decreased notwithstanding that wages increased. When a car became obsolete the Company burned it, and sold the parts as scrap. Only about 2 per cent of a car could be salved, ten per cent of the trucks and 9 per cent of the motor equipment. In a recent car scrapped the figures were: Former value $3,350; cost of body, $1,500; cost of electrical equipment, $1,200; cost of truck, $350; cost of assembling these, $250; scrap value of the body, $35; scrap value of the electrical equipment, $100, $50 for each motor; scrap value of the truck, $35; and perhaps $20 for all other parts, $190 in all. The Company believed that the salvage just paid the cost of scraping. At present prices cars were bought for $15,000 and in 1914 for $8,000. Each car was supposed to run about 40,000 miles a year. The company had now 1,150 passenger cars and 73 freight cars.

Lieut.-Col. Hutcheson, the general manager, Mr. W. F. Graves, the chief engineer, and Mr. A. S. Byrd, superintendent of power plants, also gave evidence, the first named stating that in his opinion, the proposed increase in fares would result in a decrease of 7 per cent, in traffic. The earnings of the company had been adversely affected by reason of so many young men joining the army. The cross-examination on behalf of the city was directed to show that the estimates of increased expenses by the company were excessive.

Progress in Electric Illumination

The general trend of practice for direct lighting is very decidedly toward units of low brightness. The extended use of the high-powered incandescent lamps has stimulated the appreciation of good diffusing devices which will give satisfactory light distribution but by their low brightness minimize glare. The enormous increase in commercial activities, particularly in those lines which are connected with supplies for the Government, has made night work the rule and brought a realization of the importance of proper illumination from the standpoint both of the maintenance of quality and quantity in production and of the health and comfort of the worker. Progress toward this end is evidenced in the revision of industrial lighting codes in several states and by the appointment of a National Committee on Lighting to act as a sub-committee of the Advisory Commission-Council for National Defense for the preparation of suggested regulations to govern industrial lighting, which have subsequently been published in the form of a Code of Lighting by the Committee on Labor.

War conditions have also brought about a more careful consideration of protective lighting and the best way to utilize it. Thus it has been found that in many cases inexpensive reflectors of the ordinary type may be used for lighting open spaces in and around a plant leaving the special flood lighting units for those locations requiring particular treatment. In many cases the use of a large number of properly shaded low-intensity units will avoid dangerous shadows better than high powered sources, even though the light flux from the latter is greater.

A sphere formerly considered impregnably held by the arc lamp has been finally invaded by the incandescent lamp. Motion picture projection work required light flux of extremely great intensity and the small area and high intrinsic brilliancy of the source of light in the arc has enabled it to meet the requirements in a way hard to duplicate. By using a mirror back of the filament and for a condensing lens one of the Fresnel type, it has been found possible to make an incandescent lamp which will give satisfactory results within a certain limited field of motion picture work.

The motion picture theatre has in itself become an arena in which unique lighting effects are being experimented with continuously. Thus in several cases, by the use of several circuits in each fixture, lamps of different colors may be lighted and thereby give a color to the whole illumination.

The action of the Government in attempting to save fuel by restricting its use for lighting purposes has shown in many localities the important part played by display lighting in maintaining the illumination of streets and sidewalks.—Report of A. I. E. E. Lighting Committee.

The City of Verdun, P. Q., has inaugurated the new underground conduit and lighting system, already described in our columns by Mr. A. S. Clarson, the city engineer. The lighting system, which is located on the three principal streets, was installed by the Northern Electric Company.

Electrical Industry in the Enemy Country

A report on "German Trade and the War," published by the U. S. Department of Commerce, says in regard to the electrical industry.

The electrical industry is concentrated in the hands of a few gigantic firms or combines which are related or have working agreements, so that the exploitation of foreign business is greatly facilitated. The Allgemeine Elektrizitats-Gesellschaft of Berlin, capitalized at 155,000,000 marks, has branches all over the world and also working agreements with large electrical undertakings abroad, and the other large concerns, Siemens-Halske and Siemens-Schuckert, have similar connections. In 1913 the exports of electrochemical products from Germany were valued at $69,082,000. The chief products exported were appliances for illumination, transmission of power, electrolysis, etc., valued at $17,623,000, and incandescent lamps—chiefly metallic-filament lamps—valued at $11,451,000. In 1912 Germany produced 97,161,000 incandescent lamps, imported 2,294,000, and exported 58,339,000. The exports declined somewhat in 1913. The electric concerns have also worked for military needs, and the Allgemeine Electrizitats-Gesellschaft was able to increase its net profits during the first year of the war to 26,570,000 marks, as against 18,163,000 in 1913-14. The net profits for 1915-16 were 26,487,000 marks, and for 1916-17 29,574,000 marks. The capital of the company was increased to 184,000,000 marks in 1916-17. The shares of the company were quoted at 232 at the end of 1917.

The electrotechnical factory of Max Schorch at Rheydt, which had been paying 8 per cent during the years 1910 and 1913, increased its dividend to 12 per cent in 1914. The factories of the company were fully employed during the war, night shifts being necessary at times. In 1915 the turnover was five times as large as in the preceding years, and the company distributed a dividend of 20 per cent. with a bonus of one new share for every two old shares, thus really paying a dividend of 70 per cent.

In Bavaria and Saxony steps have been taken to make the production of electric power a state monopoly. This action would seem to make impossible the institution of an imperial monopoly of electricity.

In December, 1917, the government of Prussia announced its intention to build a large central plant in Hanover for the production of electric energy. The initial production is estimated at 50,000,000 kilowatt-hours. The state is ultimately to monopolize the production of electric energy, though not its distribution. The existing private and municipal works may remain in operation, and the state is to seek close co-operation with them.

A Big Electric Picnic

A representative gathering of Toronto electrical men met in the Engineers' Club on Tuesday, August 13th, to talk over, in a informal way, the prospects and possibilities of a huge picnic, to include all men connected with the electrical industry in Toronto and vicinity. It had been hoped that conditions would favor holding such a picnic this autumn, probably within the next couple of weeks, but Mr. Frank T. Groome, who occupied the chair, in summing up the expressed opinions of the members present, concluded that it would be a great mistake to run any risk of failure by hurrying the matter forward unduly, and that it would apparently be in the interests of the industry to proceed deliberately, so that the picnic organization may be as nearly perfect as possible. It was therefore decided to call a general meeting at some later date in the near future, at a time convenient to all, so that a thoroughly representative gathering may have an opportunity of discussing the whole situation. The opinion was freely expressed that under proper conditions there should be little difficulty in getting three or four thousand people (including the wives and children) together, and with this object in view the meeting was temporarily adjourned. It is possible the matter may be discussed before the Electric Club of Toronto, when it meets again this autumn. Committees should be arranged early and a complete organization set going so that every detail may be worked out properly without any undue haste. It may be said of the idea of a monster picnic, that it met with the approval of every member present, and there should be comparatively little difficulty in making the suggestion a reality some time during the summer season of 1919.

New Plant for Pulp Company

A special general meeting of the shareholders of the Riordon Pulp and Paper Company has been called for September 10 in connection with the financing of the new plant of the Kipawa Fibre Company, Limited, which the Riordon interests will operate. The circular issued in this connection says, in part: "At the last annual meeting the directors reported that the company had undertaken the establishment of a mill at Temiskaming, Que., for the manufacture of bleached sulphite pulp. The site has been purchased, water power and timber rights secured and the construction of the mill is well under way. This new mill will be constructed and operated by the Kipawa Fibre Company, Limited, which will be managed jointly with your company and have the advantages of our experience in manufacturing and facilities for marketing the product. In addition to the investment to be made by your company, which will ensure permanent control and a large share in future profits, your directors have decided that it is advisable to secure a further sum of approximately $3,000,000 for investment in the new company, and subject to the approval of the shareholders, tentative arrangemetns have been made for the sale of bonds or debentures, particulars of which will be announced in due course, after the requisite legal formalities in connection with the issue of the securities have been completed."

Transmit at 140,000 Volts

The Consumers Power Co. has recently completed a hydro-electric plant in the state of Michigan which, though rated at only 16,500 kw., is being operated with a transmission voltage of 140,000 over a 100 mile line to Grand Rapids. This, we believe, is the highest transmission voltage on record for any considerable amount of power. Transmission is at 7,500 volts and the 7,500/140,000 transformers of 5,000 kv.a. capacity are Westinghouse manufacture. On each transformer are 120,000 volt to 140,000 volt taps arranged in 5,000 volt steps. The 140,000 volt oil switches which are type G.2, 300 amp. units, are non-automatic, solenoid-operated and set on concrete foundation. The 140,000 volt electrolytic lightning arresters, with their horn-gap structure, are also on concrete foundations and are served by a cone-stack derrick.

The War Labor Board of the United States have just awarded wage increases to the employees of street railways in 16 cities, including Chicago, Detroit, Cleveland, Buffalo and Rochester. Increases in fares are to be granted whereever they may be necessary to meet advanced costs of operation.

The minting of a six cent coin is a possibility in the United States for convenience in paying the six cent fare now charged on so many electric railways.

A Review of Recent Electrical Engineering Progress

By E. W. Rice, Jr.*

In the early days the progress of the electric science and arts was so rapid that it was relatively easy to find each year plenty of material for a review. Progress has continued and will continue, but naturally a decided tendency to saturation is shown in many directions. In some instances, this saturation can be demonstrated to be due to the fact that limits of perfection have been so closely approached that little remains of possible accomplishment. In other instances the slowing up is due to lack of knowledge, or, especially at the present time, to lack of workers, such workers having been diverted to the work imperatively needed to secure us against the attack of our enemy on the foundations of our existence.

There has been no material improvement for several years in the matter of efficiency in electrical units, such as dynamos, motors, transformers, etc. The efficiencies stated in Past-President Lincoln's address, in 1915, still remain almost exactly of the same values, and for the reasons which he so clearly pointed out.

The efficiency of conversion of mechanical into electrical energy, or the reverse, of electrical into mechanical energy, is still about 90 per cent in the average case, under practical conditions of operation; the efficiency reaching as high as 97 per cent or 98 per cent in the most favorable cases, with the large units, and falling below 90 per cent in unfavorable cases, or in the small units. The efficiency of conversion of electricity from high to low potential, as in transformers, also remains substantially the same, reaching as high as 98 plus per cent in the largest units. It is obvious, as Lincoln pointed out that no material change can be expected where such practical perfection has been reached.

Increase Efficiency in Converting Water to Electric Power.

The conversion of mechanical power of falling water into electrical energy by our water-wheels and electric generators has increased from about 87 per cent to 90 per cent in the largest units of 40,000 h. p. This represents about the limit which may be expected.

In the field of thermodynamic engines, represented largely by the steam turbo-generator unit, some improvement has been obtained. Lincoln stated that 75 per cent of Rankine efficiency had been obtained in some large modern steam turbo units in 1915. This has now been increased to about 80 per cent is quite common practise even in such moderate sized units as 10,000 kw. This improvement, while not large is doubly important because of the great increase in the cost of fuel. It has been realized mainly by bringing the practical design more nearly in accord with the theoretical, by increasing the number of stages or processes of steam extraction, reducing various losses, and by improving many details which, when properly looked after make in the aggregate, gains of practical importance.

Increase in the initial pressure of steam and lowering of terminal pressure, by better condenser arrangements, have also contributed to improvement, as it enables an increase in the range of temperature to be utilized. This makes possible better thermal efficiencies, even with the same per cent of Rankine efficiencies.

The following information illustrates the improvement in efficiency of turbo-electric units beginning with the first 5000 kw. installed in this country, in 1903, and continuing up to the close of 1917:

Year	Size, kw.	Steam Conditions: Steam pressure	Superheat fahrenheit	Back pressure	Lbs. per kw-hr.	Per cent. of rankine efficiency
1903	5,000	175 lb.	0	2 in.	24.00	37.8
1908	14,000	200 lb.	125°	1½ in.	13.50	66.1
1911	20,000	235 lb.	100°	1½ in.	13.20	67.0
1913	20,000	200 lb.	200°	1 in.	10.74	75.9
1916	20,000	250 lb.	250°	1 in.	10.00	76.5
1917	35,000	230 lb.	200°	1 in.	10.14	78.7

It is gratifying to note that a percentage of Rankine efficiency of approximately 80 has been reached. This progress reflects great credit upon the designers of turbo-electric machines and is a record of achievement found only in electrical development.

Improvements in Steam Producing Devices.

Concurrently with this improvement in the turbo-electric machines, great advances have been made in the design and operation of steam producing devices—the boilers, and in auxiliaries and other features of the modern power station. As a result the thermal efficiency has been rapidly improved. The thermal efficiency to which I refer may be stated as the ratio of the total energy produced at the terminals of the generator, to the total energy in the fuel burned—expressed as a percentage. It takes account of all losses from the coal under the boiler to the electricity at the dynamo terminals. It is the ratio of the heat units equivalent to one kw.hr., divided by the similar heat units in the fuel consumed to produce one kw-hr. at the generator terminals.

This thermal efficiency is after all, to the electrical engineer, the most important measure of progress. It measures the advance in station fuel economy, and as stated, many factors in addition to the improvement in turbo-generators have contributed to the result. Thermal efficiency may obviously be used to express the results of a single unit, consisting of turbo-generator, with its bank of boilers and other accessories, or it may be used to designate the combined result of all the units in a given power station.

The progress in the case of a combination unit, i.e. turbo-generator, with its boilers, auxiliaries, etc. has been as follows:

Year	Size of unit kw.	Thermal efficiency per cent.
1903	5,000	10 15
1908	14,000	15
1913	20,000	18
1917-18	35,000	21.6

For comparison, I may state that large gas engines in steel mill practice, under best test conditions, show 25 per cent thermal efficiency, but in actual operation, an efficiency higher than 18 to 20 per cent is rare.

High compression oil engines of the Diesel type, driving electric generators, realize 25 to 26 per cent thermal efficiency when new, but are difficult to maintain at such efficiency.

The figures given must not be confused with the much higher thermal efficiencies often quoted for gas and oil engines, which refer to indicated horse power and not to electrical output.

Further Advances Possible in Steam Turbo-electric Unit.

The steam turbo-electric unit has not reached its limit of thermal efficiency. Calculations show that, with pressures of the order of 500 lb. gage, a thermal efficiency of 26 per cent should be easily realized. For any further substantial improvement, we must look to new methods, such as the

*President A, I. E. E. Before Annual Convention.

use of two fluids, for example mercury and steam, as planned by W. L. R. Emmet. This method is still under development but its progress has been hampered by the pressure of war work.

As a matter of interest of electrical engineers, I may say, parenthetically, that the steam turbine in this country owes its existence and development almost entirely to the electrical engineer, and this is not surprising as the electrical engineer was familiar with the advantages of rotary machines, and perhaps it is not too much to say, prejudiced in their favor.

While, as stated, the efficiency of electrical units reached about its limit some years ago, those familiar with electrical engineering development are aware that progress has been made and is still possible in the generation, transmission and utilization of electrical energy. The struggle for improvement in efficiency has been transferred from the unit to the aggregate, called the system. We cannot have a system of maximum efficiency without units of maximum efficiency, but individual units of highest efficiency do not, of themselves, insure that the system upon which they are used will be of the highest efficiency, so progress has been made in the direction of improving the system economy or system efficiency.

To obtain the highest efficiency in practical operation, the element of time enters as a powerful factor. Our conception of efficiency should not be limited to a consideration of the relation between the instantaneous value of available heat units in coal and the electrical units produced at the point or points of consumption, but should consider the relation between the total number of heat units in fuel consumed in a given time, say 24 hours, to the total number of electrical units produced and used in the same time. The attempt to improve the efficiency of the system has shown the necessity for utilizing the generator units and transmission and distributing systems, for the maximum possible time.

Elements in the Efficiency Problem.

This has led to the study of such questions as load factors of generators, of stations, and of the system as a whole, to the study of the diversity factor, to the reduction of idle currents in alternating current systems by the use of synchronous condensers, and to means for the reduction of the constant and no-load losses in all machinery, in transformers, etc.

The resulting improvement has been effected, not only by changes in designs of the units themselves, but also by their method of use, based upon the recognition of the fact that the elimination or reduction of the losses at light load will greatly improve the total efficiency, especially when the time of use of the apparatus under load is a small part of the total time.

Automatic substations for transformers and synchronous converters have come into existence; different power houses of the same system have been tied together electrically; transmission lines of different systems have been interconnected, so that the units may be usefully employed for the maximum period, or lie idle or unloaded for the minimum time.

This general development has led to marked improvement in total energy efficiency, represented by the amount of fuel burned per electrical unit sold or utilized, and has also reduced cost of operation and charges for investment. There is still room for continued improvement in this direction and the progress will be rapid due to the pressure for maximum efficiency in the use of coal and of existing investment at the present time.

Plants Linked Together for Exchange of Power.

Many interesting examples of the methods and devices adopted to improve station and system economy and efficiency may be found throughout the country. In California, large electrical systems have been arranged to be tied together electrically, for exchange of power. In Washington and Idaho, power systems under different management have made similar arrangements. In the South, all important hydro-electric systems have been tied together for exchange of power. The advantage, as I have stated, of such arrangements is better utilization of variable stream flow, improvement in load factor, increased reliability of service, and the net result is to improve the efficiency of the system, not only financially, but in a purely technical sense. One most important advantage is the obvious reduction of the necessary investment in reserve machinery of every description.

In Montana, eight hydro-electric plants successively use the same stream flow, the total effective head amounting to 600 feet, and not only is the natural flow of the stream thus successively utilized, but all the storage water is effectively used by each plant in series. In this same system, the yearly load factor is stated to reach 75 per cent and the monthly load factor to reach 80 per cent.

The interconnection of hydro-electric plants brings about another extremely important saving, based upon the variation of rainfall in amount and time on the different watersheds which are thereby brought to serve a common system. It frequently happens that there will be plenty of precipitation on one watershed, while another watershed may suffer from long continued drought. This condition varies not only in the same year, but in different years. Interconnection serves to eliminate these variations by a process of averaging, and where the inter-connected system covers a sufficiently wide area, a remarkable increase in total useful power is made available.

It has frequently happened that thousands of horse power have been wasted over the dams of one system, the watersheds of whose plants happened to have a wet year, and at the same time, a nearby hydro-electric plant, supplied by another watershed, was without water power. The result has been that one system wasted power, while the other was suffering from a power shortage which would frequently be made up by burning a large amount of high grade coal, in the operation of an auxiliary steam plant. This condition has to a large extent been remedied by the interconnections to which I refer.

Interconnection May Increase Efficiency 25 Per Cent.

It has been estimated, and it seems a conservative estimate, that through the saving in reserve equipment, improvement in load factor, and the diversity of different loads, the useful output of groups of large systems may through interconnection be increased about 25 per cent.

Electric regeneration of power, that is the utilization of the weight of trains running on a down grade due to the force of gravity to generate electricity which is fed back into the electric system to help other trains up grade, is an illustration of the same important improvement in the system efficiency.

I have thought it desirable to call your attention to the improvements obtained in system economy of efficiency because of the important savings in investment, in coal, in transportation, in labor and material, which in the aggregate have already been realized. It illustrates the wonderful flexibility, value and economy of a general system transmitting energy by electricity, compared with any other possible method.

These advances have been more rapid during the last year, due to the imperative demands for economy, saving and increased efficiency imposed by the war. It is a great satisfaction that the foundation had all been well prepared during the times of peace.

The development of our industry has been so rapid that the need of intelligent and constructive standardization was

realized some years ago. The Standards Committee of the Institute, formed in 1898, has been of inestimable value to the profession and to the industry. The standards adopted have been flexible enough to ensure progress and yet to discourage variations which were valueless. The standards promulgated by our committee have so appealed to the profession and to the industry that they have been cheerfully followed, and I am convinced that, as a result, the cost of electrical apparatus to the consumer has been greatly reduced over a number of years and the quality has not been sacrificed, but has been improved. I consider that the money value of the work so done could be conservatively placed at many millions of dollars.

Sixty-cycle systems have shown, during the past few years, a more rapid growth than 25-cycle, and it is now estimated that 60-cycle systems represent about 70 per cent of the total power supplied in the country. This is undoubtedly due to the lowered cost of transformers, generators, induction motors, and similar apparatus. The relative growth of 60-cycle as compared with 25-cycle systems is reflected in steam turbine installations. In 1910 about 60 per cent of the steam turbine energy of the country was supplied from 60-cycle units; in 1917, this had risen to approximately 75 per cent.

This is an instance where standardization is desirable and economical. It will hasten the time so often predicted, when a network of transmission lines, carrying electrical energy, will cover the country. These will be fed by superpower stations, suitably located with respect to cheap reliable supplies of coal for fuel, and water for condensing purposes and into the same network will also be fed energy from the various hydroelectric installations.

Electric Furnace Comes to the Front.

Marked advances have been made during the past year in the application of electricity to the electric furnace. It is estimated that the number of electric furnaces in the United States has been increased about 40 per cent in the past year and that there are now in operation over five times the number that existed five years ago. The world's output of steel from electric furnaces has grown to approximately four million tons per annum.

Experience has demonstrated that the electric furnaces can utilize the cheapest and most inferior raw material to produce steel of the most uniform and highest quality, with the greatest regularity. The cost of steel so produced, while reasonable, considering its quality, was higher, until recently, than that produced by the open-hearth method. It is now possible to produce electric steel at substantially the cost of that produced by the open-hearth method. This result has been brought about partly by the increased cost of the open-hearth method, due to a variety of well known causes, but largely by a reduction in the cost of electric furnace operation. The marked change which has taken place in the reduction of the cost of operating electric furnaces is based upon greatly increasing the rate at which energy is delivered to the metal, both during the melting and the refining period. This has reduced the time required for an individual heat and also the kilowatt hours required per ton of metal melted, with a net result of increasing the daily output of the furnace.

As a concrete example, I mention the history of a five-ton furnace. It was originally supplied with 800 Kv-a. at 80 volts. This was increased to 2000 kv-a. at 150 volts for the melting period and about 1400 kv-a. at 100 volts for the refining period. The time for the heat was reduced from six to three hours, power consumption was reduced from 877 kw-hr. to 588 kw-hr. per ton, and the number of heats per 24 hours was increased from three to five, increasing the net output from 15 to 25 tons.

Electric resistance furnaces of large sizes, for special heat treatment requiring unusual exactness, are being extensively used, producing results greatly superior to oil or gas fire furnaces.

Electric welding, both by the arc and incandescent method, is being rapidly extended and is destined to greater development in ship-building and similar operations.

The Electrical Engineer's War Activities

Electric engineers have been devoting much time to the solution of many war problems. It is not desirable or possible to review such work at present, but when the veil is lifted, we will all be gratified with the result. We must content ourselves with the mere statement that this work has covered means for the detection of the pirate submarine; wireless signalling and telephoning for army and navy, and aircraft devices; searchlights of novel design and great power; improved methods in manufacture of ammunition and ordnance; electro-chemical work of every description; electric welding; X-ray sets of greater simplicity and accuracy and many other lines too numerous even to mention.

The great industrial research laboratories, the educational and governmental research departments have all cooperated enthusiastically and effectively, and the members of their staffs have labored day and night, without regard to pecuniary reward or public applause, sustained entirely by the high purpose of giving their best to the service of the country. I hope the time may come when the story may be told, so that the world may realize the debt which it owes to scientific men and engineers, without whose arduous, unselfish and almost inspired work, our cause, righteous as it is, would have no chance of a victorious conclusion.

In my address at the opening of the mid-winter convention of the Institute, in February, 1918, I called attention to the advantages which it seemed to me would follow a more general electrification of the steam railroads of the country. I merely repeat at the present time that electric locomotives have been so improved and simplified that they are competent to haul the heaviest train that can be held together with the present train construction; to operate at the highest speed permissible by the alignment of the road and independent of its grades; and that the electric locomotives can meet in the most efficient and adequate manner the transportation problems confronting the country, and offer better results than are now obtained or seem possible with steam locomotives.

Electrification Would Help the Transportation Situation

There can be no question that railroad electrification is not only economical but imperatively needed to improve the present standards of steam operation. Our mountain districts are congested almost entirely by the limitations of the steam railroad systems, and the addition of more tracks, under such conditions, is not the best solution of the problem. The electrified divisions of the steam roads have been free from troubles during the past severe winter and I repeat that the coal famine which the country suffered last winter could have been largely avoided if the steam railroads had been electrified. Moreover, it should not be forgotten that steam locomotives burn about 25 per cent of the entire coal mined in the United States and that 12 per cent. of the entire ton mileage movement of freight and passengers carried over our railroad tracks is represented in cars and tenders required to haul coal to supply steam for the locomotives.

It is a truism, which has been frequently stated, that war requires the mobilization of the nation's industries and their devotion to essential work. This is especially true in this country, as it has been necessary in addition to create substantially new industries on an enormous scale, such as the production of ships, ordnance, ammunition, airplanes,

chemicals etc. To operate these industries, it has been necessary to mobilize to the fullest extent our available material and labor, but material and labor can only be converted into war work by the application of power. This power, in view of its great economy and flexibility, must be electrical.

While this country was fortunate in having available a magnificent system of power stations, so great was the magnitude of the demand for increased power, created by the war industries, that it is estimated that there will be a shortage of at least 500,000 kw. of electric power in the Eastern district.

It takes from one to two years to build and equip the large units which are essential for the production of such power. This illustrates the importance of all of the methods which I have mentioned to conserve, utilize and increase the efficiency of existing equipment and investment, as such methods can produce results in a much shorter time.

It is, however, vitally important that the great electrical power producing companies of this country should be helped in every way to meet the heavy demand which is placed upon them. It has been demonstrated that the quickest, most efficient, and altogether best way to meet the demand for power is through the expansion of such existing organizations and installations.

Fortunately, there is general appreciation of the fact and comprehensive schemes are under consideration which will provide for the erection of large steam electric power stations in the mining regions. Favorable locations exist which are within reach by transmission lines of electric power stations now serving large industrial areas. By interconnection, present investment and machinery will be better utilized and a large amount of additional electric power made available, without making any increased demand upon our congested railroad facilities.

It is evident, therefore, that we need to consider and put into effect, every practical method for conserving our existing developments, and also, we should take a courageous view of the future; we should provide, for the future growth at least as liberally as has been the custom of the managers of the great public service systems in the past. It has been their custom to build from two to three years in advance of existing requirements, in anticipation of the future. I have yet to learn of a single important instance where such foresight has not been amply justified.

I would say in conclusion that the saving in fuel, by such improvements as I have mentioned in various parts of my address, amounts to many millions of tons every year; the saving in material and investment represents millions of dollars, which manifestly represent service of the highest value to the industry and to the country. Such work is just as much the province of the electrical engineer as improvements in the design and efficiency of the electrical units, and requires the same scientific ability, vision and industry.

While I admit to considerable prejudice in favor of things electrical, I think that in no other field of engineering has there been such a remarkable improvement and a condition which so nearly approaches, in the matter of efficiency, to 100 per cent, as has been shown in the field of electricity. This phenomenal record is not the result of accident. It has been due to the enthusiastic devotion of the scientist and engineer and executives to their work. They have not been satisfied with things as they are, or with mediocrity. They have wanted the best; have not been contented with a 75 per cent. to 80 per cent. efficiency when something better was obtainable. The causes of inefficiency have been scientifically attacked; the loses have been studied and their causes discovered and removed.

Handsome Montreal Showrooms.

The cut herewith shows the interior of the new sales and show room of the Montreal Light, Heat & Power Consolidated, at the corner of Mountain and St. Catherine Street, Montreal. The lower floor is utilized for the display of various electrical and gas fixtures and appliances, and as the cut indicates these are effectively arranged. The whole interior is very attractive. At the rear are the cashier's desks, and next to these is the rest room, furnished with Persian rugs and easy chairs. The windows are also utilized for the showing of appliances. A large electric sign is erected over the entrance on St. Catherine Street.

Engineers and the European War

By Major General William M. Black*

It is an honor to be privileged to address you on a subject of such importance to our country, the duty of the Engineers in war. Although the part played by Engineers in this war is great and the responsibilities of the profession are correspondingly large, this war, like all wars in the past, is and must be a war carried on in accordance with the principles of the art of war, which are unchanging and which have been recognized and taught ever since organized armies were first created.

Do you realize that almost the only absolutely modern method of warfare now in use is the warfare of the air? The invention of submarines was made during the American Revolution, and submarines were used successfully, though to a limited extent, in our own Civil War. Gas and flame fighting are of ancient origin. Trench fighting is hardly better known to-day than it was to the veterans of Grant and Lee, of Sherman and Johnson.

Engineer Must Add to His Peace Equipment.

The advances in human knowledge have caused corresponding improvements to be possible in the weapons of warfare. Increased knowledge of chemistry has produced more powerful explosives and improved methods in metallurgy have enabled these explosives to be utilized, by making possible heavier and more powerful guns. Improvements in the means of transportation have enabled larger bodies to be moved more quickly and more readily and to be subsisted and supplied with greater certainty. The telegraph, the telephone and the wireless have afforded a means of prompt communication and have enabled larger bodies of men to be given coordinated action. With such changes, battles are fought on the same principles and won or lost from the same causes as in the time of Alexander the Great. This war has been called a people's war and so it is in the sense that due to modern facilities the entire resources of the people can be utilized to-day as they could not have been utilized in the days of old. It has also been called an Engineer's war because in the quickness of movement and in the works necessitated by these modern inventions the services of Engineers become more conspicuous and perhaps more necessary than in the past. But engineering in warfare has always been essential and it is even doubtful whether the science of engineering does not owe its birth to the works of war. An Engineer myself, I would be the last to belittle the work of our profession. It is a matter of pride that the men of our profession, due to the nature of their employment in time of peace, are, of all the civil professions, most prepared to serve the country in war, but to serve the country adequately in war, the Engineer must add to his peace equipment for professional work. The profession of arms is a profession in itself and it is the profession which deals with the very greatest in magnitude of all the endeavors of men. The effective use of an army which is properly constituted exemplifies the best that men can do in organization, in discipline and in the devotion to duty which causes a man to regard his own life as a thing of small moment toward the attainment of the end sought.

Deluge of Suggestions.

There would be a great amount of effort saved if our people recognized more clearly the existence of the technicalities of the profession of arms. The government is simply deluged with suggestions and so-called inventions for the winning of the war. The records show that about 98 per cent of all of these are without military value and that time and labor have been thrown away by men eager to help, but entirely ignorant of the history and conditions of warfare.

An example with which some of you are familiar is the electrical gun. For years the possibility of such a weapon has been a fascinating line of study to electricians. The principle of the solenoid is the germ. If a series of solenoid coils were to be energized and de-energized in succession sufficiently and rapidly, such a series around a tube can be made to impart a movement of translation and rotation to a projectile. But practical results are to-day impossible. A six-inch service rifle having a length of 20 feet, fires a projectile weighing 110 lbs. with a muzzle velocity of 2,600 ft. per sec., or in other words, the projectile leaves the muzzle with a kinetic energy of translation of 115,500 ft-lb. This energy has been stored in the projectile during its travel through the bore of the rifle, or say in 1/65th of a second. The average power expended has therefore been at the rate of 7,607,500 ft-lb. per second or about 14,000 h.p. or 10,500 kilowatts. These figures are simply approximations and neglect entirely the power required for imparting velocity of rotation and for overcoming the friction in the bore. You can easily estimate the weight and dimension of the generating equipment which would be required for even a moderately powerful gun were all the mechanical and electrical problems of its manufacture solved, and making due allowance for the short-load periods. You can understand the impracticability of transporting the electrical plants required for any number of such guns, and the impossibility of distributing this power over shell-swept ground to guns whose position must be constantly shifted, and which must be put in action on a few seconds' notice. I think that you will agree that until new discoveries give a much improved method of storing or generating electricity, smokeless powder will continue to be the most compact and convenient form of stored energy for guns.

And yet there has been a good deal of time and money wasted in trying to perfect such a gun by men whose patriotism is undoubted, and whose ignorance, also, is undoubted. In other words, if a man has an invention or an idea of an invention, by all means let him work on it, but before he goes to Washington and takes up the time of men busy trying to devise means to beat the Boches, let him make sure that he knows the conditions of war and what he is trying to do to meet those conditions, and then if he is sure of the means, let him present his ideas and inventions to the proper authorities.

We want all we can get and want the best we can get. We want the inventive power of our coutry if it can be exercised to do good.

Inventors' Home Proposed.

There was a proposition made seriously at Washington recently that the United States should provide a fund, of I do not know how many million dollars, and make a Home for Inventors, where any one who thought he had an invention would be able to go, and work it out at the public expense; and recently, although we had a committee of experts there to pass upon these inventions, the results were so utterly unsatisfactory to the inventors that they came in a perfect horde upon the secretary of the navy and the secretary of war, so much so that they had to make a brand new committee of three men, who could be much better occupied

* Chief Engineer, U. S. Army, before A. I. E. E. Convention.

to go ahead and do this same thing, and I am only waiting for the next wave of inventors to show that this committee can suit them one particle better than the old one did.

In addition, without doubt, there are many men in our country of the highest patriotism who are sore-hearted because they are not given something to do directly toward the winning of the war. They do not understand, that some condition peculiar to themselves, possibly age, possibly physical condition, possibly mere ignorance of war and its conditions, compel it that the bit that they must do for their country at this time is to continue in their work in civil life and do their part in keeping up the normal life of the country—in itself a service of importance.

The part which engineers are now playing in the war is a very great one. The records of the American Institute of Electrical Engineers show that out of a total membership of 9443, there are 973 in the service, or 10.3 per cent of its roster. The American Society of Civil Engineers with 8,753 active members, has 14 1-3 per cent in the service. The American Institute of Mining Engineers 10.4 per cent, and the American Society of Mechanical Engineers 10.1 per cent. But these records are not complete. At the outbreak of the present war there were in the Engineers Corps of the Regular Army about 300 officers and approximately 3,500 enlisted men. At the present time there are about 8,000 commissioned officers and 200,000 enlisted men men, made up of men formerly engaged in works of an engineering character. It is probable that this does not represent much more than one-half of the number of the profession now serving in the army.

Engineer Works in the Van and the Rear.

Let us consider the nature of the work of the Engineer, passing from front to rear of the army.

First in importance is the work of the sappers. They go before and remove obstacles, clearing away obstructions, building bridges and roads, making the trench systems complete, mining, providing light, water, lines for supply (light railways or roads) and military mapping. In this category enter practically all of the branches of the profession. Further to the rear are found the construction and operation of railways; road and bridge construction; the construction of veritable towns for supply depots, with all their accessories, drainage, sewerage, lighting and water supply; construction of quarters and of hospitals; and furthest to the rear, the construction of the ports of debarkation with their wharves, storehouses, railway lines, yards and shops, all with their sanitary systems. Separate from these activities, but necessary for their supply, are the Forestry troops who turn the growing timber into lumber of the dimensions required for the various services. Locomotive and car shop troops are performing essential services. Topographic Corps, Sound Ranging Corps and Camouflage Corps are also among the varied activities of the engineers.

What preparation is required for the fulfillment of these varied duties? For the actual technical work of construction or installation the civil training of the engineer should prove sufficient when the plans which embody the military features have been prepared, or when the military technique has been learned and assimilated. A fundamental of this military technique is that the time element is to be considered rather than money cost and that the work must be done with whatever materials are available. This requires clearness of conception of the results required, resourcefulness and organization —factors also required for civil work.

As stated earlier, due to the very small numbers of the personnel of the corps of engineers of the regular army, reliance had to be placed in the members of the profession in civil life. Confidence in their devotion to country and in their ability has not been misplaced. The results already accomplished prove this fully. Could more have been done? Undoubtedly, had the profession been better prepared for the call.

Sound General Education Requisite to an Engineer.

Will you permit me to say a few words concerning the general training of our engineers, based on a professional experience of more than forty years? The conviction has been forced upon me that in educational matters, as in many other affairs of life, we Americans are inclined to go too fast. The basis for any professional career where the highest is to be attained must be a sound general education. Does anyone of you regret the lessons gained in your own experience? Is not the experience of humanity as shown in properly written history of almost equal value? Would Russia now be in the sad condition existing had her people known that the experiments she is trying have always resulted disastrously? Yet is history thus considered in an ordinary technical course? Again, do you not find a knowledge of the general principles of law and of the special rules of the laws of contracts of value? Are these considered essentials? What is the handicap of an engineer who is unable to express his ideas clearly in spoken and written English? Is this taught thoroughly in our technical courses?

It goes without saying, that the study of pure and applied mathematics is found in all technical courses. But, are these subjects well grasped before their application in special technical courses is studied? Is any faculty of an Engineer of greater value than the ability to form a mental picture of his problems and of their solution? Yet is that study which assists most in this faculty—descriptive geometry—properly apprehended? Is there any branch of the profession which in its application is not based on a knowledge of topographical work, on a knowledge of construction materials and of how these should be used? Is the study of these branches of civil engineering insisted upon sufficiently in the mechanical and electrical courses? In effect would not our professional men be better equipped for their civil work were they not in too great a hurry in their youth to enter directly into life's combat? Does not this war teach that without a long and elaborate preparation down to the last details, an attempted "drive" must fail?

These remarks apply to all engineers, both military and civil. In the rush of war men cannot always be hand-picked for special jobs and frequently it becomes necessary for an available man to be used for the work immediately necessary, irrespective of his previous training. In this supreme test of humanity the best man is he who is prepared to meet any emergency—perhaps not in the most finished way—but to meet it.

There are things that the engineers in this country can do. If they do know enough to give us some ideas for helping along in the killing of Boches, for God's sake let us have them. If they do not, what they can do is to help the supply of men for the winning of the war. We are now short of officers of engineers, very short, and we are going to be very much shorter. We must have educated engineers for this work, and we must not only have the men for the line of work of the army, but we must have mechanicians and artisans and laborers for the special work.

All of you men have spheres of influence—do your best in them, and if you can be used otherwise, and the problem comes up in which we need you, you may be sure you will be called upon. There is is problem now, the supply of men, in which you can help, either by your own personal sacrifice, in going out, or by influencing others.

Now as to soldier work. The movements of drill and the construction methods peculiarly military are easily learn-

ed. The knowledge of the art of war which will enable these to be applied promptly and properly is more difficult. But most difficult to acquire is the peculiar mental discipline which makes the soldier. The Army is a huge machine which must work co-ordinately in all of its parts. That competition, which in civil life causes one body to advance further and faster than another, is out of place in an army. All must work together and for one common end. Each man must so subordinate his will and desire to the common good as to work willingly and earnestly in the sphere allotted to him. This does not mean that all initiative is to be suppressed. On the contrary each man must use his initiative to the utmost, but in his own allotted sphere of action. Each must learn to obey and obey from the heart. Through such obedience comes the knowledge of how to command when command becomes a duty. All of this is hard to learn. But each man who is called upon to help in this war must learn it, if he would help effectively.

By all means let us have military training in our schools, but let it be true military training and not tin soldier work.

There is another line of technical military knowledge which must also be studied hard. The machinery for the organization, training, supply and leadership of troops; the methods of obtaining, accounting for and issuing supplies; of keeping returns of the men; and the channels of command must be studied. To civilians in general this is wholly unknown, but if a man is to be of service in the army, it must be learned until its use becomes automatic.

Sound Ranging

I wish I could go into greater detail as to the work of these sound ranging corps, because it comprises some new electrical work of the highest character, and the apparatus for it has been perfected in this country. We took the best devised at the beginning of the war, and our physicists went to work and have made marked improvements. Perhaps you do not know what sound ranging is. The artillery is stationed in the rear of the line. There is almost no direct artillery fire any longer—that is, as a rule, the gun is fired from a point where the target cannot be seen at all. The first thing to be destroyed, invariably, is the enemy's artillery, then the trenches are attacked. The obstructions of wire are torn to pieces, the trenches themselves are practically leveled, and after that is done, in the assault, there is what is termed the barrage fire. That, I suppose you know, means a fixed or slowly moving curtain of shells dropped on a certain given line and through which passage is almost impracticable.

On both sides the artillery is carefully camouflaged so it cannot be seen from aeroplanes. To show what care is taken, even the tracks that are made in taking the guns to the front are wiped out, the guns themselves are covered, so that neither from an observation balloon nor an airplane from the enemy's line can the position of the gun be seen, and in order that the flashes of the gun cannot be located, there are dummy guns placed at intervals, and flashes from these guns made by electricity, so that the position of the real guns cannot be known.

In order to determine the position of the real guns, there are delicate instruments which have been devised, which are placed at intervals along the line. These instruments are for the purpose of registering the sound of the gun. There is, first of all, the sound of the gun in firing. That is preceded frequently, if the range be great, by the sound of the shell passing through the air, and sometimes by the bursting of the shell itself, before the sound of the gun comes. These are all recorded, and the velocity and the direction of the sound is known. By having these instruments at different points on the line, the position of any one gun can be "spotted," and "spotted" so closely that our own artillery fire can be directed and the gun blotted out. That is one of the improvements of modern warfare rendered possible by the advance in general human knowledge, particularly in electrical knowledge, and these instruments are very exact.

This service of the rear is of great importance and magnitude. Picture to yourselves what is required to transport, house, supply and maintain a million men three thousand miles from home, producing nothing and in their work expending enormous amounts of materials.

Establishing and Maintaining the Army.

Taking the question of storage alone, the provision of space required for an army of $1,000,000 for ninety days aggregates 20,000,000 square feet of floor space of covered storage and double that amount of uncovered storage space, with the necessary railway tracks for receipt and shipment and for classification yards, aggregating about 650 miles. Add to this an equal mileage of highways, adequate provision for water supply, sewerage and electric lighting and power and you can realize the work involved in this one item. Add to this the constructions which have been built at the ports of debarkation (at one of whch 375,000 square feet of wharf space had to be provided), the hospitals, barracks, shops, and the lighting, water and sewerage systems required, and some conception of the actual new construction work done, can be formed.

It is estimated that the supply of the army requires the transportation to the front of 25 lb. per man per day. This makes heavy demands on the French railway systems, good as they are. These have had to be supplemented in all but the main line trackage, and a large amount of motive power and of rolling stock has had to be supplied and operated.

Among the special services, the work of the geologists must be mentioned, and in the line of improved apparatus, it may be stated that new instruments and methods for airplane photography have been devised and introduced. Other new auxiliary aids for fighting have been worked out, some of which have already proved their value on the battlefield.

Yes, the engineers are doing their work well. Be it in constructions in the rear, or under fire, be it in the transportation of ammunition to the firing line, the construction of strong points and obstacles, the construction and destruction of bridges in the face of an enemy, or as in recent instances, under the feet of the enemy, or be it with their rifles in beating back an attack, they are doing and dying. All glory to our comrades in arms in France! There is not a red-blooded American who does not envy them.

Electrical Trade After the War

Recently the British Board of Trade appointed a Departmental Committee on Electrical Trades to consider the position of the British electrical trades after the war, with special relation to international competition, and to report what measures are necessary or desirable in order to safeguard that position. The report of this committee has just been made public. The report points out that the value to Great Britain of the electrical manufacturing trade already amounts to 22½ millions, sterling, a year, but that this figure only represents a fraction of the trade that can be obtained if the blunders of the past are rectified. The war has demonstrated that the safety of the Empire is dependent on the employment of electricity. The prosperity of the industries depends largely on cheap energy for driving machinery. The applications of electricity to agricultural purposes is also commanding attention. The scientific replanning of the distribution of energy would effect a saving of 50,000,000 tons of coal per year, which would at the same time reduce the

cost of power for manufacturing, lighting of streets and buildings, propulsion of railway, tramway and road vehicles. The report is summarized in the following recommendations:

(1) A thorough reform of the legislation and conditions under which the generation and distribution of electricity are promoted and administered in this country which will involve modifications in the relevant Acts and Regulations, and a like reform of the legislation and conditions affecting the promotion, construction, and operation of tramways and light railways.

(2) The prohibition of import of enemy goods for a period of three years after the conclusion of peace, subject to importation under license in special circumstances after the expiration of the first twelve months.

(3) The imposition of import duties sufficiently high to protect effectively the electrical industry.

(4) The prevention of the sale in the United Kingdom of any imported electrical goods at prices lower than those current in the country of origin.

(5) The recognition of the advantage of combination among manufactures and official co-operation with such action.

(6) The prevention of any concern engaged in the electrical or allied manufacturing industries, if controlled directly or indirectly by enemy capital, from continuing to trade within the Empire, unless it be specially authorized and its constitution made public, and the passing of legislation requiring that not more than 25 per centum of the capital in any other electrical or allied undertaking shall be held either directly or indirectly by enemy subscribers or their agents.

(7) The treatment as enemy products of all goods produced in foreign countries by concerns controlled by enemy capital or under enemy direction.

(8) The exclusive acceptance of British tenders by State Departments, public bodies and companies supplying electrical energy under statutory powers.

(9) The adoption by Government departments and public authorities, so far as is practicable, of standard types and patterns of plant and apparatus.

(10) The prohibition of transport discrimination operating to the detriment of British manufacturers, and the provision of improved transport and cargo handling facilities.

(11) The promotion of a better understanding between employers and employed and the provision of better housing and working conditions.

(12) The provision of extended banking facilities, preferably by the establishment of industrial banks, to enable British manufacturers to secure and finance contracts and engineering enterprises.

(13) The recognition of the permanent and ever-increasing importance to the Empire of the natural sources of power for the generation of electricity in the British Dominions, and the introduction of safeguards by legislation or otherwise to prevent these national assets from passing into alien hands or under alien control.

Electrical Industrial Trucks and Tractors*

There is no longer an question of the utility of electric storage battery industrial trucks and tractors. In fact, the success of these small members of the electric vehicle family has been so pronounced that it is now a manufacturing rather than a sales problem,—the demand being greater than the supply, although manufacturing facilities have been increased not only by extension to plants, but by several new manufacturers entering this virtually unlimited field.

Nor is this development of a temporary, mushroom growth associated with efforts being made to expedite war measures, although the necessities of war have emphasized the value of these modes of interior and exterior transportation as encountered in industrial establishments, factories, at railroad and steamship freight terminals, warehouses, etc. And these units are playing a major part in the manufacture and transportation of vital munitions, both in this country and allied countries abroad.

Later, when we can speak more specifically of war operations, the intimate story of what electric trucks and tractors have contributed to our success will make very instructing and fascinating reading. In the meantime it is sufficient to know that they are discharging very important assignments most creditably.

The economic advantages of the electric truck and tractor are so great that actual results ofttimes seem to parallel the fantastic and absurd claims of some "get-rich-quick" stock selling schemes calculated to separate persons from perfectly good coin of the realm. Therefore, justifiable claims have been considerably modified and reduced so that prospective users would not suspect that they were being asked to buy gilded gold bricks. Even when such large "factors of safety" have been applied, the very modest claims advanced sometimes apepar to the uninitiated to be extravagant. However, results in practice are so much greater than what might have been anticipated that such users promptly become effective exponents of such means of transportation, their enthusiasm being rapidly transmitted to others in need of such transportation service. If ever the phrase "advertised by our loving friends" applies, it is in order with electric industrial trucks and tractors, for users are proving to be the most valuable sort of a sales organization, even although they are not on pay-rolls of the manufacturers.

A story is told how a railroad in the West arranged for a demonstration of electric industrial trucks with six separate manufacturers, each of whom placed on trial for ninety days, without charge, one unit. At the end of ninety days the railroad purchased six trucks out of the savings effected during the free trial period. This comes pretty near being "something for nothing." It is needless to state that such free trial practice has been discarded just as same has been exterminated in other branches of the automobile industry, where, in the early days of the development, such generosity was grossly abused. However, this example illustrates effectively the economic advantages of such modern transportation.

The Crouse-Hinds Co. of Canada are distributing a folder on marine condulets, which are made in special water-proof types and meet every marine requirement—from ordinary elbows to junction boxes, lamp outlets and high capacity plugs and receptacles. The same company have issued catalogue No. 1000 H, describing the ZY series of Saftey First Motor Switch Condulets—"The last word in small motor switches"; well illustrated.

Trade Publication

A very attractive treatise has been prepared by the British Aluminum Co., Ltd., 60 Front St. West, Toronto, and is being distributed with the compliments of Mr. E. V. Pannell, local manager. The booklet is entitled "From the Falls to the Factory—A Treatise on Electric Power Transmission." It is divided into eight sections, dealing respectively with: Transmission Line Design; Conductance and Tenacity of Aluminum; Tension and Sag Problems; Spans and Supports; Aluminum Steel Cables; Construction and Costs; Modern Transmission Lines; Tables and Data. The booklet is very well illustrated with photographs and line drawings, and contains a quantity of very timely information assembled in the smallest possible space.

The Dealer and Contractor

Strong Toronto Delegation at Annual Convention of National Electrical Contractors and Dealers—Discuss Wider Canadian Organization and Affiliation — Mr. Goodwin Coming to Toronto

The 18th annual convention of the National Association of Electrical Contractors and Dealers took place at the Hollenden Hotel, Cleveland, Wednesday, July 17, with a strong Toronto delegation in attendance. Messrs. L. O. Horner, W. F. Dean, of the Canadian General Electric Company, F. P. Davis, of the Northern Electric Company and F. J. Allen, of the Benjamin Electric Manufacturing Company of Canada and the following members of the Toronto Electrical Contractors' Association: Messrs. J. Everard Myers, treasurer; Harry Hicks, vice-president; E. C. Clarke, E. A. Drury and Kenneth A. McIntyre, president.

For a considerable legth of time the Goodwin plan and the re-organization of the National Association have attracted the attention of the electrical fraternity. The Toronto association has been in correspondence with the British Columbia Association of Electrical Contractors and Dealers, having in mind the possible Canadian affiliation with the National Association of the United States, involving, of course, an adaptation of the Goodwin plan to Canadian conditions.

With the primary object in view of learning more of the Goodwin plan and hearing of it from Mr. Goodwin himself, and also of discussing with officials of the National Association details of the projected Canadian affiliation, the above mentioned delegation visited Cleveland. In retrospect it is rather difficult to give an accurate report of the proceedings—there was so much of interest and of benefit to all, together with unbounded enthusiasm.

At the very outset of things it was announced that Mr. W. G. Rose, president of the Cleveland Advertisers' Club, was on hand for the express purpose of pumping enthusiasm into the delegates. This purpose was accomplished so successfully that its effect was evident throughout the entire proceedings.

The papers read at this convention were unique in their real worth and in the valuable information made available to the average contractor-dealer. These papers will be reviewed in later issues. Most of one session was taken up by a round-table conference on labor-cost data. The material for this was largely prepared by the Electrical Estimators' Association of Chicago. Estimates of typical classes of construction were followed through from beginning to end and several systems of checking results were explained. All of this data is to be issued by the National Association in data sheet form for the benefit of the members of the Association. This information was prepared at a great deal of trouble and expense for the entire electrical contracting industry which is thereby greatly indebted to the people who made it available.

Thursday morning Mr. James R. Strong, of New York, gave his very lucid explanation of the organization plan of the National Association. Then came Mr. Goodwin, who unfortunately had suffered a broken ankle as the result of an accident. This hampered his movements somewhat but did not detract from the forcefulness of his explanation of the Goodwin plan.

Following the morning session the delegates, through the kindness of the Cleveland Contractors' Association, were conveyed to Nela Park, where they were entertained at luncheon by the Nela Park officials. Nela Park is a delightful spot and every consideration seems to have been shown to make it an ideal place for the employees. Following the luncheon the afternoon session was held at the Grove at Nela Yark, a sylvan setting with rustic benches and platform. At this session the electrical contractors' duties to the Nation were explained by Sullivan D. Jones, Washington representative of the Association. Mr. Jones devotes his entire time to representing the contracting industry in Washington and, consequently, is in very close touch with such affairs. Mr. Dwight D. Miller, of the Society for Electrical Development, gave a very complete paper on the Application of Electricity as Applied to Industrial Plants. Toward the end of Mr. Miller's paper all the whistles in Cleveland seemed to break forth at once and with such volume of sound that it was quite impossible for the speaker to be heard. It turned out that the excitement was created by the news of the beginning of the allied drive in France. Receiving this explanation the meeting broke up enthusiastically and paraded from one end of the grounds to the other, assembling finally in the main square to hear impromptu speeches. This celebration deservedly gave opportunity for the delegates to vent their enthusiasm.

That evening the Canadian delegates gave a dinner to Mr. Goodwin, Mr. Peet the National chairman, Mr. Strong chairman of the National Constitutional Committee and Mr. Arnold, chairman of the National Membership Committee. At this dinner they discussed ways and means of Canadian affiliation. The following morning the National Association, on the recommendation of their Resolutions Committee, unanimously adopted amendments providing for a fourth, and Canadian, division. This Canadian division will be a unit and at the same time an integral part of the National Association.

Mr. McIntyre sent a telegram to Mr. Williams, president of the Vancouver Association, informing him of this arrangement, which was really Mr. Williams' idea. Later in the day a telegram was received from Mr. Williams saying that the British Columbia executive had approved and would recommend national affiliation at their annual meeting in September. This was very good news indeed and indicates that the Canadian electrical contractors are not too slow to take advantage of the opportunity presented in this larger field of usefulness.

Two evenings were given over to social entertainment

The Twenty-One Planks in the Goodwin Platform

The Goodwin Plan Advocates:

1.—A strong and representative association of electrical contractor-dealers (retailers) and urges all interests to lend immediate assistance to this end.

2.—That each division of the industry prepare a code of ethics outlining its own functions, relations and responsibilities to each of the other divisions of the industry.

3.—That each division establish a code of practice outlining its methods, policies, etc., in dealing with other than divisions within the industry.

4.—Improvements in merchandising methods, better display, and the encouragement of more retailers, by urging present contractors to open retail stores, thereby enlisting the support of central stations and offering a broader and larger outlet for manufacturers.

5.—Recognition of the service functions of the contractor-dealer and recommends a differential when this service is performed.

6.—The sale of high-grade electrical material; the establishment of high-class specialty retail shops; improved specifications in wiring installations; and the introduction of liberal use of convenience receptacles.

7.—Broader education of the public concerning the problems of the electrical industry, and concerning electricity, its use, and the application of household devices.

8.—Retailers applying intensive sales methods in connection with small devices used in home, factory, office, etc. (such as washing machines, vacuum cleaners, dishwashers, electric ranges, electric heaters, household heating devices, sewing machine motors, fans, lamps, portables, fixtures, vibrators, hair dryers, ice machines, etc.).

9.—The introduction and application of proper cost-accounting methods in wholesale and retail merchandising, particularly if either function is a minor department of a company.

10.—Free and unobstructed flow of trade along most economic channels, without attempt to direct it through fixed channels.

11.—That central stations conduct retail departments for the sale of lamps, appliances, devices, portables, etc., and operate same in accordance with the ethics of retailing and with full regard to proper cost accounting.

12.—That all interests conduct retail departments, to be operated at a profit. The adoption of this policy on part of central stations and jobbers will result in a large number of concerns entering the retail field.

13.—Recognition of the service function of jobbers in the distribution of supplies and recommends a differential when full service is performed, and a proportionate differential when only a partial service is rendered.

14.—Jobbers determining, through proper sost accounting, the cost of warehousing, and selling their principal commodities, to the end that each principal commodity will carry its proper portion of overhead.

15.—Open meetings of all trade associations, including meetings of executive committees.

16.—That the electrical press become an integral part of each division by honorary or associate membership, and that unrestricted publicity be given the proceedings of all meetings.

17.—The formation of a national lecture bureau, with state and local staffs. The function of the staff would be to carry on educational work within the industry and before public gatherings. Service to be gratuitous.

18.—Recognition of the principle that any action taken by a single division which affects another division is seldom satisfactory unless each division affected is represented.

19.—The appointment of committees by the National Electric Light Association, Electric Supply Jobbers' Association, National Association of Electrical Contractors and Dealers, and various manufacturers' associations to meet together to study the problems of the industry and to cooperate in finding their solution.

20.—Consolidating or reconstructing overlapping organizations. A committee comprising representatives from each association should be formed to study this question and submit a plan.

21.—Eventually a single organization in the electrical industry, consisting of national, division, state and local sections; also main national sections for the solution only of functional problems of the several branches or groups.

and the banquet on Friday was notable for its friendly spirit and the sentiments expressed by everybody present.

The Toronto delegtation are unanimous in their thanks to the officials of the National Association and the Cleveland Association for the warmth of their reception and the many courtesies shown during their stay. They will not soon forget the Cleveland annual convention of 1918.

The National executive committee have accepted our invitation to hold their quarterly meeting in Toronto, October 14-15-16. We are doing our best to arrange to have Mr. Goodwin present. The big event will be a banquet Monday evening, October 14, to which is cordially invited representatives from all branches of the electrical industry to hear a paper on the Goodwin plan and to see it started in Canada.

The manufacturers and jobbers are willingly co-operating in this campaign to reach the electrical contractors and dealers in all parts of the province of Ontario. During September it is expected that the Ontario Association of Electrical Contractors and Dealers will be formed and the contractor-dealers on October 14-15 will be given an opportunity to taking their place in the Canadian movement.

The Goodwin plan has been printed and re-printed time and again, but some way or other there is considerable misapprehension on the part of many electrical men as to just what the actual interpretation of his plan may be. Perhaps the whole situation is best explained by saying that Mr. Goodwin simply advocates the exercise of common sense in the solution of the electrical problem. Indeed, after reading his platform one cannot resist the temptation to say, "Why, of course, that is the natural thing and just what I have always advocated." Mr. Goodwin does not raise any contentious points, does not ask any one element in the industry to sacrifice anything to any other element. His plan means a common benefit to all interests concerned.

In reading Mr. Goodwin's platform, therefore, do not look for anything difficult to understand. Do not try to read anything in between the lines. His scheme is as simple as it looks, and it looks as if it would work out very simply. Electrical Merchandizing in its latest issue has taken the trouble to pick out the salient features of Mr. Goodwin's platform, submit them to him for approval and publish them in such definite shape that we feel we cannot do better than reproduce them word for word for the benefit of our readers. The arrangement of twenty-one planks printed herewith is taken from that magazine:

The Goodwin Plan

A campaign of education conducted principally through trade papers, trade organizations and other channels, to coordinate the various interests in the electrical industry and to bring them together in harmonious action, so that there may be established retail distribution of electrical materials at fair prices to the consumer, and at a fair profit to all parties taking part in the transaction. The basis of the plan is:

First: that each individual owes a responsibility to the organization representing his branch of the industry.

Second: That the organization owes a similar responsibility to its members.

Third: That each organization representing each branch of the industry owes a responsibility to all other organizations in the industry, all to the end that all problems may be discussed, having in view the interests of all, thereby providing a basic plan for more adequately and efficiently serving the general public, resulting in an extension of the activities of our industry to the great undeveloped field before us.

Objects of the Plan

Intensify development in present fields.

Extend the industry to undeveloped fields.

Develop greater efficiency in the industry.

Procedure

First: Bring together the various interests in the larger cities, cause them to formulate a plan to extend the work to the smaller towns and cities of each locality.

Second: To accomplish this, committees should be appointed from each of the four divisions of the industry, forming local committees charged with the duty of making a study of local problems and co-operating in their solution.

Third: Individuals comprising these committees will report their activities to their national associations, causing their national association to take similar national action, looking to the solution of national problems.

Results

To produce harmony and develop co-operation between manufacturers, central stations, jobbers and contractor-dealers.

To produce greater efficiency in the distribution of manufactured products.

To increase per capita consumption of electricity, apparatus, devices and supplies.

Establishment of high-class stores.

Decrease in costs of conducting overlapping trade associations, and saving of personal time incident thereto.

Create a more favorable public opinion.

More Convenience Outlets for More Business How to Sell and Estimate

The Society for Electrical Development, in connection with their "convenience" outlet campaign, have issued a folder entitled, "How to sell and estimate," from which the following extracts are taken:—

Follow the Code

In using the Electrical Code of the National Fire Protection Association, remember this: It prescribes merely the minimum requirements to permit the securing of insurance and generally to pass the city inspectors. Therefore, for the sake of safety, comfort and convenience, it is wise to provide a wider margin. No one ever complains of too many outlets either for lighting or for labor saving devices. A switch in line saves time—and money.

Be a Salesman

Do not try to sell copper wire, plugs and receptacles. They won't enthuse anyone. Sell the Idea of what pleasure they will give by making toasters, fans, percolators, chafing dishes, grills, etc., possible.

How convenience outlets will save backaches, burnt fingers and dirty houses by making electric cleaners, washers, and irons available.

If the housewife says she cannot afford these "luxuries" tell her to buy what she can and these will soon save her in time and labor enough to buy the others. She can buy appliances piecemeal, but wiring can't be done that way.

If anyone ever talks to you about dangers of shock from electricity, tell them it isn't possible with good workmanship. Thousands of people died in their beds last year in Massachusetts from preventable diseases, but not one fatality was due to electricity in the home, according to the official state reports. Then you might add that electricity eliminates the disease of overwork—it saves the price in doctor bills.

Making Estimates

Don't guess on a job. Figure your material, your labor, the time lost between shop and job and leave enough margin to pay you for your time in supervising or inspecting the work.

If you haven't your own blanks, use the forms provided by this Society.

Survey the premises to be wired, measure them up, make

of your costs. Use first class material and see that the work is well done and you make a friend of your client to whom you can sell the many appliances that will surely be wanted when the "convenience outlets" are there.

Don't cut your specification or prices and turn out a bad job.

Explain to your customer that key sockets are designed for 250 watts only, while toasters, percolators, irons, etc., take from 400 to 600 watts. Putting these things on loaded lighting circuits means bad lights and trouble if not danger.

The location of outlets must be determined on each job but there are a few fundamentals to be remembered.

Floor receptacle in dining room should be off the centre of the dining table to avoid leg.

The wall receptacle can be placed in base board, wainscoting or preferably at four feet from the floor in the wall near door or window frame.

Two-way plugs are very useful but should not be used on key sockets for heavy current-consuming appliances.

Convention of B.C. Contractors and Dealers is Finally Fixed for Sept. 13 and 14 in Victoria

The second annual convention of the British Columbia Association of Electrical Contractors and Dealers, which was advertised to be held at Victoria, B.C., on Friday and Saturday, Aug. 16 and 17, has been delayed a month, to permit of perfecting the plans and organization. Capt. W. J. Conway, secretary, in writing of the postponement, repeats the cordial invitation originally offered to any electrical men who may be in the vicinity of Victoria on Sept. 13th and 14th. In the following notice, which is being distributed widely, complete information of the convention is given:

ELECTRICAL MEN EVERYWHERE

are invited to the

SECOND ANNUAL MEETING

of the

B. C. ASSOCIATION OF
ELECTRICAL CONTRACTORS AND DEALERS.

to be held at Victoria, B.C.,
Friday and Saturday, Sept. 13th and 14th, 1918,
Boat leaves Vancouver 10.30 a.m., Friday

MEETINGS BANQUETS PICNIC

THIS IS GOING TO BE THE GREATEST "ELECTRICAL MEETING" EVER HELD IN WESTERN CANADA.

ALBERT ELLIOT OF SAN FRANCISCO WILL BE WITH US

ALL ELECTRICAL MEN

Including Managers, Power Company men, Wholesalers, Engineers, Contractors, Retailers, Salesmen, Etc., and their wives and families are cordially invited to share in this great ELECTRICAL HOLIDAY, and at the same time meet and talk to men in the same business.

For further information, particulars of boats, trains, etc., write or phone to

The SECRETARY,
B. C. ELECTRICAL ASSOCIATION,
406 YORKSHIRE BUILDING,
VANCOUVER, B.C.

Square D News Item Service for Immediate Release

The Square D Company, Walkerville, Ontario, steel enclosed switch manufacturers, call attention to some of the very important features of their Square D safety switches, which are approved by the Hydro-Electric Power Commission of Ontario. The switch is of very simple construction, completely enclosed in a sheet steel box, so designed that ample wiring space is provided inside to make the necessary connections, and the corners of which are electrically welded, thus assuring great durability. The box is provided with a hinged cover, held closed with a simple spring, and the switch is operated by a crank handle located on the outside. Raised letters on the box indicate the "on" and "off" postion of the switch.

The switch may be locked in the "off" position to prevent accidents while repairs are being made on apparatus controlled by it, provision being made for three individual padlocks. The advantages of these are obvious where there is more than one man working on the line or equipment. When each man starts to work, he locks the switch in the "off" position. This eliminates the possibility of either man throwing the switch "on" before all are finished working. Means are also provided to seal or lock the cover shut to prevent unauthorized persons over-fusing the switch or tampering with live connections in any way, but the electrician has access to it at all times and can make his tests or inspection without stopping the motor or delaying production.

The switch is provided with a quick-break mechanism which is absolutely positive and insures a simultaneous break at all blades. This positive action makes longevity of the copper blades and the switch jaws a certainty. Another feature is the interchangeability of end plates, which are furnished blank with knock-outs, or with porcelian outlet covers for open wiring, according to installation requirements. Convenient knock-outs are furnished in the sides of the switch, and make possible "Tapping-off." Their catalog contains description, specifications and prices of these switches, as well as valuable motor wiring data, and will gladly be sent on request.

Mr. Mahoney Leaves Westinghouse

Mr. J. N. Mahoney, for 12 years a member of the Westinghouse engineering department, has tendered his resignation to open consulting offices in New York. For the last 8 years, Mr. Mahoney has been in charge of designing switches, fuses, and circuit breakers for this company and is largely responsible for the progress that has been made in this class of apparatus. Previous to this work he was connected with the railway engineering department in charge of control design. Mr. Mahoney is a member of the American Society of Mechanical Engineers, the American Society of Mining Engineers, the American Institute of Electrical Engineers, and the American Electrochemical Society, and his wide acquaintanceship and broad experience in electrical work should be of great assistance to him in his new field.

Salisbury Electric Co. Ltd., electrical engineers, contractors and manufacturers of electrical supplies, formerly of 49 Wellington St. East, Toronto, announce that they have closed their old offices, and moved to larger and more commodious premises at 615 Yonge St. The new shop will be known as "The Electric Shop," and the building is called "The Electric Building."

Schumacher-Gray Co., Winnipeg, Man., have secured the electrical wiring contract for the additions being made to the Winnipeg General Hospital. This company's tender was $13,350.

Seven Trustworthy Prescriptions for the Business Ills of the Contractor-Dealer

The Society for Electrical Development, now right in the thick of their campaign for an increased installation and use of "convenience" outlets, are sending out a quantity of valuable information designed to assist central stations, contractors, dealers, jobbers and manufacturers to complete and carry through their own organizations. In the July issue of their Monthly Sales Service they give what is described as "Seven trustworthy prescriptions for electrical business ills." It is pointed out that every business, large or small, needes a good tonic from time to time because there are many ailments in the retail electrical industry. For this reason they have prepared these 7 tabloid tonics, which it is hoped will prove of assistance, both internally and externally, to every electrical merchant. These tonics are printed below:

Make Capital Go Further

A fruit peddler can teach you lessons in merchandising. Every morning he buys a load of bananas; before night he's sold out.

Turning over his capital every day, Sundays and holidays, he does a gross business of over $5,000 in nine months on a $9 investment. In forty years he could do a gross business of $292,000 on that capital.

What would he make if he had $9,000 capital?

The average electric shop turnover is supposed to be four to eight. There are retailers who turn their stocks as many as twenty times! How? Why—they keep close records on sales, on purchases. They buy in small quantities—and often. They keep correct records, and use them. They do a big profitable business with little capital.

Better less business—at a profit—than volumes at a loss!

B'guess and B'gosh Retailing

Eliminate guess-work from your methods. Govern your business from knowledge. Learn, look, see, hear, make notes—don't guess.

Why aren't you making profits—when others are? Why don't you grow faster?

The United Cigar Stores Co. doesn't guess! It uses facts as guide posts. "How many people pass a certain place daily?" No guess-work! It counts 'em. That determines location. What goods sell best? It keeps records—and proves it! What clerks deserve first promotion? It watches, checks up and rewards the worthy. It's all the result of simple, self-study—self analysis.

"You haven't the time to do this?"

Do you take time to see your doctor, your dentist? If your business is sick—take the time to doctor it. The ills of the inlustry should be an open book to you! Diagnose your own ailments! Then apply the remedy. Act!

The prescription is "cut out guess-work!" Keep records—even if you have to get outside help to do it.

What Does It Cost You to Do Business?

Records show average cost of doing business among electrical retailers to be over 30 per cent.

A Central Station new-business manager claimed his cost was only 13 per cent. Investigation proved his salary (as well as that of other people who devoted a part or all of their time in this department) was not charged against that department. Nor was light—because "the company made its own current." And there were other items—rent, for instance—not charged against the sales in that business. And he thought he was making a profit on his merchandise, whereas he was losing money daily, with every sale.

In scientifically managed stores the salaries of clerks average 9 per cent. of the gross sales by those clerks. Salaries of managers, bookkeepers, and other employees who do not sell, run the average cost for salaries up to around 14 per cent. of the gross sales.

Rent averages around 4 to 5 per cent.—and is going up. Delivery around 1½ to 2½ per cent. Light and heat about the same.

No electrical dealer should assume these percentages to be his costs. He should get his costs from his own business. These percentages are only standards to enable him to judge whether his own are higher or lower than the average.

Classify your expenses into such accounts as will give you the information you need. Keep tab and record of every item of expense.

You can fool yourself by failing to charge all expenses into your cost of doing business but your expenses will come out of your gross profits just the same.

The Profits in the Sale

A man bought just enough drygoods to take care of one day's sales.

He closed his store at the end of the first day and went to the city to buy more stock; arranged for a good many days' supply to be shipped as needed—one day's supply at a time, cash to be paid on delivery. Now he owns two big stores with net profits of $25,000 a year.

Ninety-five per cent. of all retailers over-buy. Jobbers can prove it.

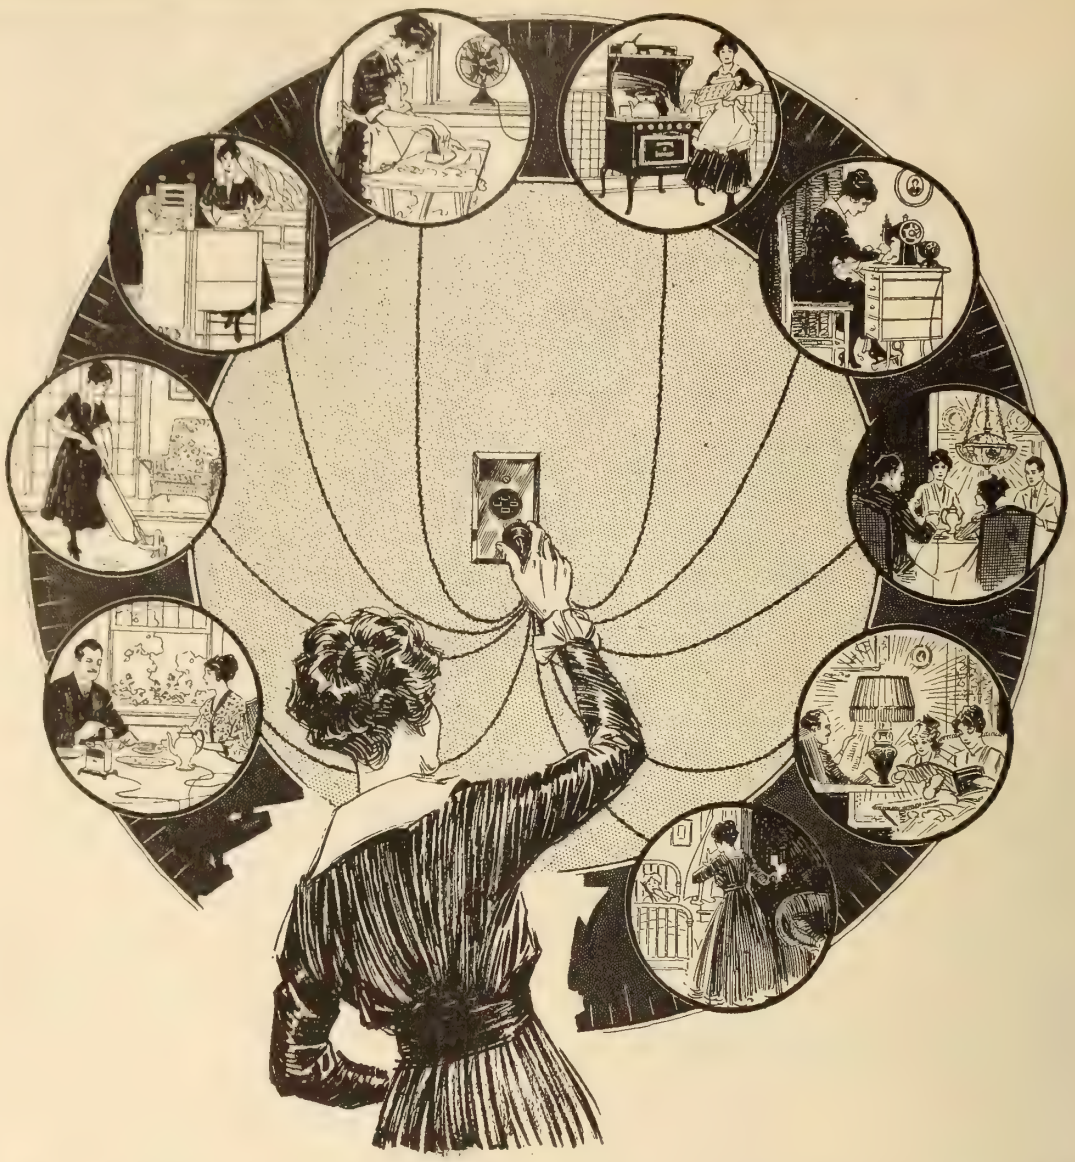
Few electrical dealers keep adequate stock records.

Hungry salesmen, and overly-ambitious clerks, advise buying heavily against an "advance in price," which doesn't always materialize. Records should show whether to buy or not!

Overhead charges against 11 dozen lamps on the shelves which don't move quickly, eat up the extra quantity discount on the 11 dozen and the percentage which the retailer makes on one dozen lamps.

Keep close record of stock!

Make your stock records show what, when and why to buy in large lots. Buy in small quantities—then you don't lose so much if the goods don't move.



Are You Making Less Than You Think?

Investigations show that a majority of retailers' profits are imaginary. While electrical sales often run to a high figure, profits are on paper.

Many electrical dealers, while estimating their cost of doing business on a certain percentage of the gross business (which is the selling price) add this same percentage to the cost when figuring prices of individual items. This usually results in a loss.

An appliance sold for $9.25 wholesale. Freight and cartage were 75 cents. Total cost $10 set down in the store.

To meet competition profit was cut down to 10 per cent. net. So 18 per cent. of the cost was added for cost of doing business and 10 per cent. for profit, making the sale price

SAVE - FUEL - TIME - FOOD - MONEY - BY WIRE

Electricity lessens every task of housekeeping, home-making.
It saves the housewife, and her help, miles of steps, hours of effort and dollars of expense.
Therefore you should increase the convenience and efficiency of your Electric Service by having your home equipped with

Convenient Service Outlets

These outlets provide handy places where you can "plug-in" your Electrical Appliances without unscrewing bulbs from the fixtures or otherwise disturbing the lighting system . . . . They also do away with dangling wires that are often unsightly and in the way . . . . Inconspicuous, little affairs, set into the floor, base-board, wainscoting or wall. All that can be seen is a small, neat brass or porcelain plate. Can be placed wherever handiest, within arm's reach, in any room. Very easily installed without disfiguring floor or walls, mussing up the house or disturbing the home routine. Study the picture—doesn't it tell an interesting story?

Right Now we are offering a special opportunity for the installation of these Convenient Service Outlets . . . , One of our experts will call at your home—at the time most suitable to you—offer suggestions, help you plan, give full information . . . . There will be no charge for this and you will not be obligated in the least.

An advertisement suggestion by the Society for Electrical Development in connection with their "Convenience Outlet" Campaign—An especially attractive cut—Why should not the Canadian Contractor-Dealer profit by this campaign?

$12.80. The retailer thought he was making a profit of $1.00. But was he? Let's see:

The article cost $10 and he wanted 28 per cent. gross profit (to cover 18 per cent. for cost of doing business and 10 per cent. net profit). He considered the selling price as 100 per cent. and cost price as 72 per cent. or all of that 100 per cent. except the gross profit of 28 per cent.

Now if $10 is 72 per cent. of the selling price, the selling price must be $13.89.

As he worked it out:

Selling Price	100%	
Cost doing business ...	18%	
Net profit desired	10%	
Gross profit	28%	
Wholesale cost	72%	
Cost price, in percentages..	.72	$10.00 cost in money
		13.888 Selling Price

An analysis of the problem shows:

72% = $10

1% = 1/72 of $10 or 10/72

100% = 100 x 10/72 or 1000/72 or $13.888

To prove back the problem:

$13.89 Selling Price	$13.89 Selling Price
.28 Percentage	3.89 Gross Profit
11112	$10.00
2778	
$3.8892 Gross Profit	

Thus, figuring correctly, it took $2.30 of the $2.80 gross profits to cover the 18 per cent. cost of doing business.

It is not claimed that this method of figuring profit on the selling price is the only right method. School arithmetics have always taught that in percentages the cost price is the base. And, it should be remembered that the per cent. of profit added to the cost price is always a profit on the cost price, and not a percentage on the money taken in.

That method is all right. However, as your profit is to come out of the selling price, it is considered by many to be safer to figure on the selling price.

The percentage of profit and the percentage of cost of doing business must be figured on the same base. When they are, you need only be sure that your average mark-up gives the margin of profit you deserve and expect. If you don't have that margin on your books, in your cash drawer, or in the bank, at the end of the inventory period, you should make it your business to find out why. Remember—records will help.

Don't get your percentages mixed. That's the crux of the problem of profit figuring.

Sluggish Sales and Dusty Stock

It pays to handle electrical merchandise that goes fast. Look at your store! See those stocked shelves. Dust covered merchandise means dormant dollars.

Records should show you exactly how much you will sell of every line each day—should show you whether to keep a two week's supply or a month's supply of each line!

Don't pay business-street-level prices for storage space. Either sell the goods or stock them where the rent and insurance won't eat up the profits.

The wise merchant has sold his goods by the time he gets the jobber's bill!

You can't afford to keep records yourself—and do your own selling and outside work too. Hire somebody to do a part of your work for you. Get rid of the slow movers—stick to the easy sellers!

Watch your records—and "Try to sell before you pay."

A Sale is Not a Sale Until You Have the Money

A large percentage of electrical retail business is done on credit. And since the buying power of a dollar today is only about 70 per cent. of what it was in 1914, the dealer finds it positively necessary to bring in his outstanding money. At the same time the tendency and inclination of the customer is to defer paying bills until the last minute, for to him also a dollar is today only worth 70 per cent. of what it was in 1914.

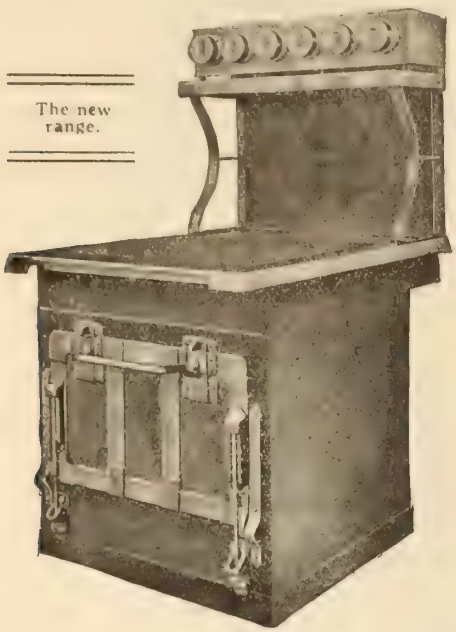
When a sale is made on credit and no record kept, the electric retailer stands to lose the profit, the original cost of the goods, the time involved (invested) in the buying and selling of the goods, the cost of labor in handling, the cost of stocking it on the shelves. Also other losses, including that big one which such carelessness will cause in other work.

Records should show at all times the money outstanding, unpaid accounts, how long accounts are overdue, and so on. Merchandisers had better sell only for cash than attempt to do a credit business with inefficient record-keeping systems, or none at all.

Recent records made in other lines of retail business, show that outstanding accounts today are 50 to 70 per cent. below what they were a year ago—depending upon the locality from which figures were secured.

Keep credit records. Get in the money.

Personals



Mr. R. R. Knox, traffic superintendent, Winnipeg Electric Railway Co., Winnipeg, has just received word from his son, Lieut. C. E. Knox, of his marriage in England.

Mr. George A. Hoadley, acting secretary of the Franklin Institute, Philadelphia, has been elected president of the Illuminating Engineering Society for the new year, which begins on Oct. 1, 1918. Mr. Hoadley was formerly professor of physics and electrical engineering at Swarthmore College.

Mr. Frank T. Groome, sales manager of the Benjamin Electric Mfg. Co. of Canada, Ltd., who has recently returned from his Western trip, reports that the Western welcome is just as cordial as ever. While in Vancouver Mr. Groome addressed the Association of Electrical Contractors and Dealers, a very active organization in our coast province, and gave them first hand information on a number of eletrical organizations in Eastern Canada, including the Toronto Electrical Contractors' Association, and The Electric Club of Toronto, with the organization of which Mr. Groome has been so closely associated. Mr. Groome states they are to be complimented on the strength and thoroughness of their organization in the West. The claim that they are 98 per cent. organized is quite correct. In the course of his address Mr. Groome took occasion to urge upon the electrical men of Vancouver and district the advisability of forming a social organization similar to the Electric Clubs of Montreal, Toronto, London, and elsewhere in the East. He explained that these clubs have been very successful in eliminating misunderstanding and friction between the various members of the industry, and in making and cementing many friendships. It is expected that the Electric Club of Vancouver and probably also the Electric Club of Victoria will result, at an early date. A vote of thanks to Mr. Groome for his enthusiastic address was moved by Mr. Mundy, of the Mundy, Rowland Co., and seconded by Mr. J. F. Little, manager of the Northern Electric Co.

New C. G. E. Agency

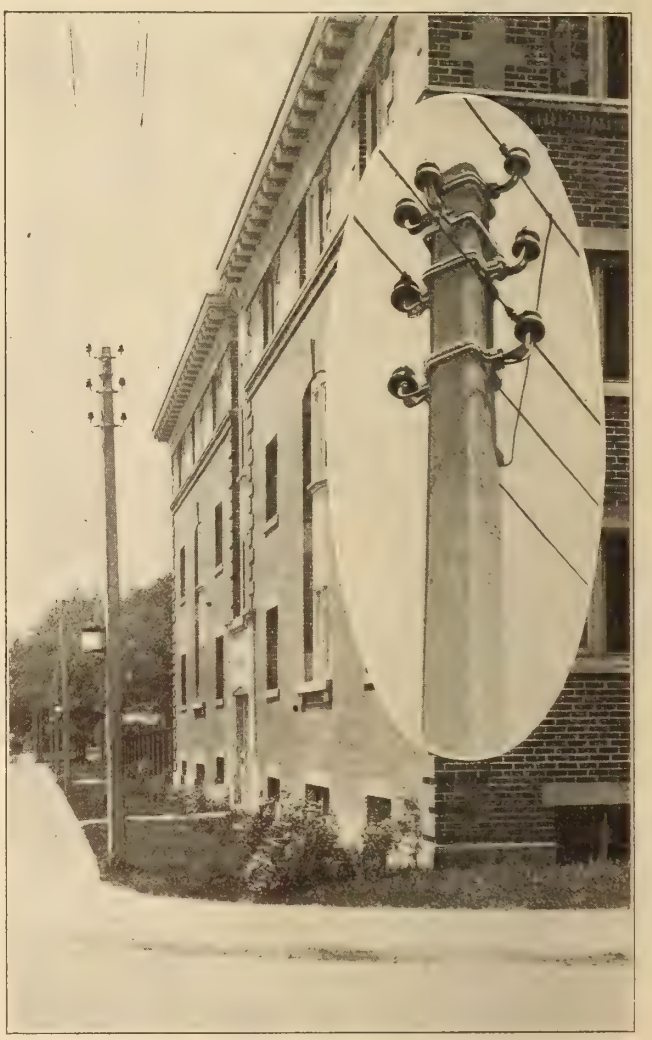
The Canadian General Electric Company have secured the exclusive agency for Canada for Neuco electric household and hotel ranges and broilers, formerly made by the National Electric Utilities Corporation, recently acquired by Lamlers, Friary & Clark. During the past four years Neuco ranges have won an enviable reputation for rugged

The new range.

design and reliability under the most severe operating conditions. The Neuco electric hotel range shown in this illustration is not only a strong and practical electric range, but its outward appearance is very attractive. The drop doors are protected by spring balances with positive catch, the wrought iron being re-inforced at all points and hinges. This unit is a complete range in itself. Additional units may be placed side by side or back to back to meet the requirements of any size kitchen.

Buss Fuses for Every Purpose.

Rose and O'Hearn, 220 King Street, West, Toronto, are Canadian agents for the Bussman Manufacturing Company, St. Louis, and handle their well-known line of cartridge fuses, auto fuses and plug fuses of every type, size and capacity required for any electrical service. Every "Buss" fuse is claimed to hold an over-load of 10 per cent. indefinitely and blow at 50 per cent. over-load in the time limit allowed by the Underwriters. The company state that catalogue and samples will be mailed on request.



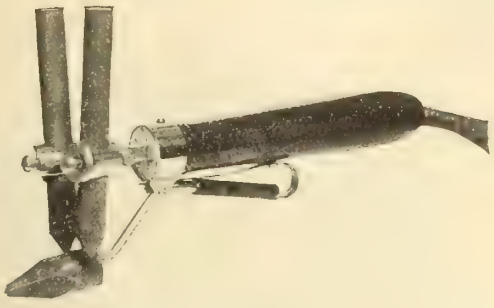
Improving Electrical Distribution on City Streets.

With the steady extension of distribution circuits for electric light, power and heating service, there has been a pressing need for an economical and substantial distribution fixture of neat appearance, and one which will firmly grip the pole without weakening it.

Such a fixture has been invented and patented by F. M. Simpson, Montreal, and the accompanying photograph shows the use of this device on concrete poles in Toronto. Certainly the appearance of the lead is very pleasing not only to one who is familiar with distribution, but to the public generally.

The fixtures or crossarms with accommodation for insulators, are made of steel channels, hot galvanized and rustproof. The attachment portion of the arm which is really the patented feature of the device is in the form of an adjustable collar with the heads of the clamping bolts held by the flanges of the channel, making spring washers or lock nuts unnecessary, to prevent creeping. Labor charges of installation are reduced as the use of a wrench is all that is necessary to make the fixture absolutely rigid. The channel sections render sufficient spring giving tension to meet weather conditions. The pole grip is especially adaptable to concrete and metal poles as these are generally uniform in size. Its use on wooden poles makes the cutting of a gain unnecessary, as the web of the channel bites into the pole and holds the cross arm without the aid of drift bolts or coach screws.

Fixtures having the same principle of pole attachment are made in several forms for two and three wire circuits, and



A new distribution fixture.

for carrying strand wire supporting cable. The fixtures are being made in Hamilton by the Acme Stamping and Tool Works. They are "Made in Canada for Canadians."

Mr. E. M. Dechene, deputy minister of the Quebec Department of Lands & Forests, states that the hydraulic service of the department has made an investigation of the water power developments of the province. Leaving out of consideration, nearly all the plants under 1,000 H.P. capacity, on account of the greater difficulty to reach them, the figures already in, give a total of 810,000 H.P. developed. With the smaller plants added the total will probably reach 850,000 H. P.

Remarkable but True

THE NEW

J.C. ELECTRIC SOLDERING IRON

Seven Hours Saved on a Ten-Hour Job

70% Time Saved.

500 H.P. Induction Motor at Burlington Steel Co., Ltd.

Instead of taking ten hours with two men to solder the induction coils of this motor, the J. C. Iron with one man did it in three hours, a remarkable saving in time.

The secret of the wonderful efficiency of this Iron is the fact that it heats only while in contact with the work, and then heats almost instantaneously.

No time is lost at any stage of the work.

Saves Labor, does not require skilled help.

Light in Weight—Rugged in construction.

Can't Burn out, because there is nothing to burn out, and the only Maintenance Cost is for Carbons.

The Fastest, most efficient, and most Economical Electric Soldering Iron on the Market.

The "J.C." Soldering Irons have stepped into the front rank through sheer downright efficiency.

Clemens Electrical Corporation

of Canada, Ltd.

Hamilton - - - Ontario.

Current News and Notes

Agincourt, Ont.

Hydro power was formally turned on in Agincourt, on August 9. This is the terminus of the Scarboro Hydro transmission line. Present charges for current are five and a half cents per kw.h. with a sliding scale according to the amount of current used.

Guelph, Ont.

Mr. E. A. Lowry, Guelph, Ontario, has, owing to greatly increased business, moved into new offices in the Herald building, Guelph, and is now better prepared to handle the additional business. Mr. Lowry is now solely handling motors, generators, transformers and large direct connected generating units of all capacities. Mr. Lowry, who has been engaged in the electrical business for a number of years and is an Associate Member of the A. I. E. E., has a well established business covering a large part of the United States as well as practically the whole Dominion.

Montreal, Que.

The Montreal Tramways Company have averted an employees' strike by submitting to a demand for increased wages.

The Montreal & Southern Counties Railway Co., has been successful in its application to the Railway Board for an increase in its passenger and freight rates. Sir Henry Drayton in giving judgment, found that the cost of the service of the company has greatly increased, and the new schedule which the company desires to make effective is just and reasonable. In his opinion an order increasing them should be issued notwithstanding any municipal agreement to the contrary. The company has agreements as to the rates to be charged with St. Lambert, Greenfield Park, and Longueuil, and it was contended that these agreements were a bar to any increase. Sir Henry Drayton, however, over-ruled this argument, pointing out that to increase the tolls in other districts without increasing them in the municipalities referred to would produce a different scale of tolls.

North Sydney, C.B.

The Sydney Mines Electric Company have raised the rate for house lighting from 11 to 14 cents per kw.h.

Portage La Prarie, Man.

The city council of Portage la Prairie, Man., will submit a by-law to the ratepayers authorizing a debenture issue of $325,000 for the purpose of constructing a transmission line from Winnipeg and bringing in Hydro-electric power.

Preston, Ont.

The Leverson Electric store at Preston, Ont., suffered considerable loss in the fire which recently destroyed a large portion of the business section.

Regina, Sask.

In connection with a recent by-law in Regina authorizing an expenditure of $175,000 for a new generating unit, the light and power department, (Mr. E. W. Bull, superintendent), have purchased a 5,000 kw. 2300 volt, 3 phase, 60 cycle C.G.E. turbo-generating unit and a Westinghouse LeBlanc surface condenser. The generator and condenser will be shipped by the manufacturers in a few weeks and will be installed and in operation by Christmas.

St. Thomas, Ont.

The employees of the St. Thomas municipal electric railway, now receiving 25 cents an hour for a nine and a half hour day, are demanding 35 cents. The cost of living, they say, has advanced 120 per cent.

The city council of St. Thomas have under consideration scrapping the present street railway system and installing electric omnibuses, running on storage batteries, without rails. The system at present is facing a heavy deficit, and it was pointed out that with these cars in operation $10,000, or over, a year could be saved in wages. There would also be a saving in power bills and there would be $15,000 worth of scrap rails to dispose of.

Toronto, Ont.

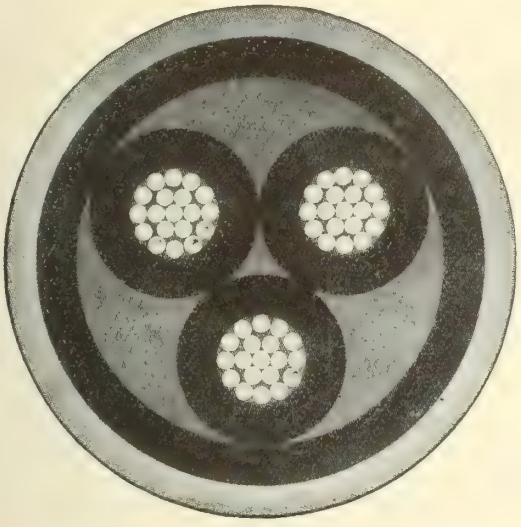
The total current expenditure of the Toronto Hydro Electric system during the first quarter of the year, according to a report of General Manager H. H. Couzens, was $356,251. The total receipts were $620,066, leaving $263,814 available for fixed charges. There is a reserve of $21,000 for contingencies, and $107,619 available for depreciation. The balance sheet shows assets amounting to $10,494,077. The surplus, as per revenue account, including $69,958, brought forward from 1917, is $177,305.

The Toronto and York Radial Company have put an order into effect which forbids the carrying of baby carriages on Saturdays, Sundays, and holidays. Passengers may check their go-carts at the station or leave them at home.

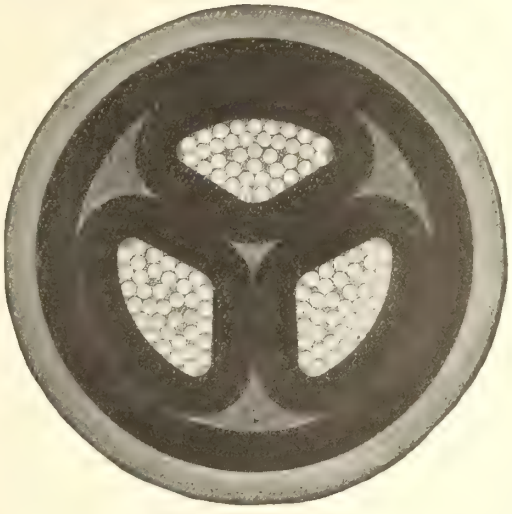
Passenger traffic on the Toronto civic car lines increased during July to 22.5 per cent. over the same month last year. The revenue for July this year was $28,285 and for July 1917, $23,262.

A Toronto man undertook some electrical installations and alterations without securing a permit. He paid $50 and costs for his neglect, the Crown Attorney pointing out the great danger arising from defective electrical work, not only to the building in which it was installed, but also to the whole neighborhood.

Windsor, Ont.



The Essex Terminal Railway Company will, it is stated, apply for permission to establish a straight five cent fare in place of the six-for-a-quarter tickets which have been in use.



Electrical Research Committee.

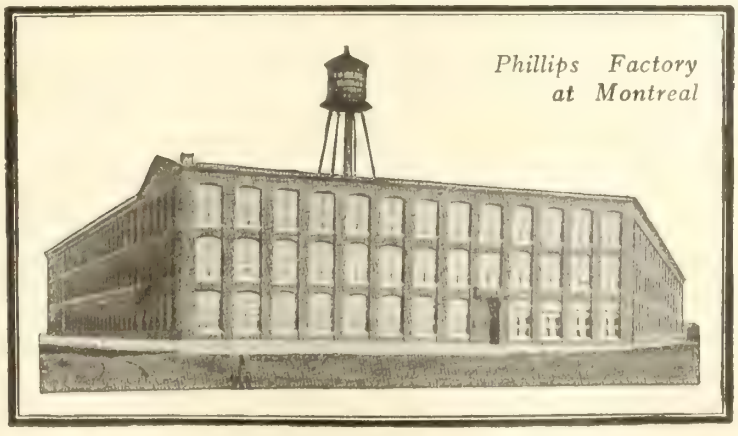
The British Electrical Research Committee, which was appointed last autumn, under the auspices of the Department of Scientific and Industrial Research, is at present engaged in superintending a research on insulating materials (fibrous materials, porcelain, ebonite, mica, composite materials), and the water-proofing treatment of insulating windings of electrical machines, in respect of which grants have been made to the committee by the Research Department, the B. E.A.M.A., and the Institution. The committee consists of three members nominated by The Institution of Electrical Engineers and three members nominated by The British Electrical & Allied Manufacturers' Association, the nominees of the former being Mr. C. H. Wordingham, C.B.E. (Chairman of the Committee), Mr. C. C. Paterson, O.B.E., and Mr. C. P. Sparks, and those of the latter Mr. F. R. Davenport, Mr. D. N. Dunlop, and Mr. A. R. Everest. The temporary address of the committee is No. 1 Albermarle Street, London, W. I., and its secretary is Mr. P. F. Rowell.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

BOILERS

For Immediate Sale

Suitable for ship yards, munition works, mines, mills, elevators, electric power stations, etc.

5450 H.P. of B & W Stationary Boilers

[illegible] steel headers, and superheaters, in [illegible] sizes.

2 [illegible] h.p. Boilers, 16 wide 12 high, 2 - 18 in. drums each, installed 1902.

[illegible] h.p. Boilers, 24 wide 14 high, 3 - 42 in. drums each, installed 1905.

[illegible] h.p. Boilers, 16 wide 12 high, 2 - 42 in. drums each, installed 1910.

1 580 h.p. Boiler, 24 wide 12 high, 3 - 42 in. drums, installed 1910.

2 515 h.p. Boilers, 21 wide 12 high, 3 - 42 in. drums each, installed 1910.

Eight of these 11 Boilers are now allowed 150 pounds steam and 3 are allowed 135 pounds. All in operative condition.

If it is desired to add to the capacity of any [illegible] boiler plant carrying 200 pounds pressure by superheating steam turbines, these boilers can be easily adapted to 200 pounds pressure by being fitted with new drums.

To be sold as they now stand, including grates and the usual boiler connections and fittings attached to them. Purchaser to make his own inspection, to have access to all available records in Owner's possession, and to remove Boilers at his own expense.

If prompt possession of any or all of these Boilers is desired, time will be saved by Purchaser sending his representative here without delay.

Correspondence desired only with parties who have immediate use for any or all of the Boilers.

Feed water closed type feed water heaters, and boiler feed pumps belonging to this plant are also for sale.

DIRECT READING OHMMETERS

Thompson-Levering Co., Philadelphia, Pa., U. S. A.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL
The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"
Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"
Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"
Fire-resisting paint, or colorless solution.

"ARMACELL"
Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"
Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"
for coloring electric lamps. Used in the Royal Navy. Weatherproof. Dries rapidly.

"ARMABRON"
Bitumen protective paint, elastic, acid-resisting, weatherproof.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Hand-Book on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Ins. 332 pages, illustrated. Price $2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

Electrical Meters, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price $6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illus-

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:
"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

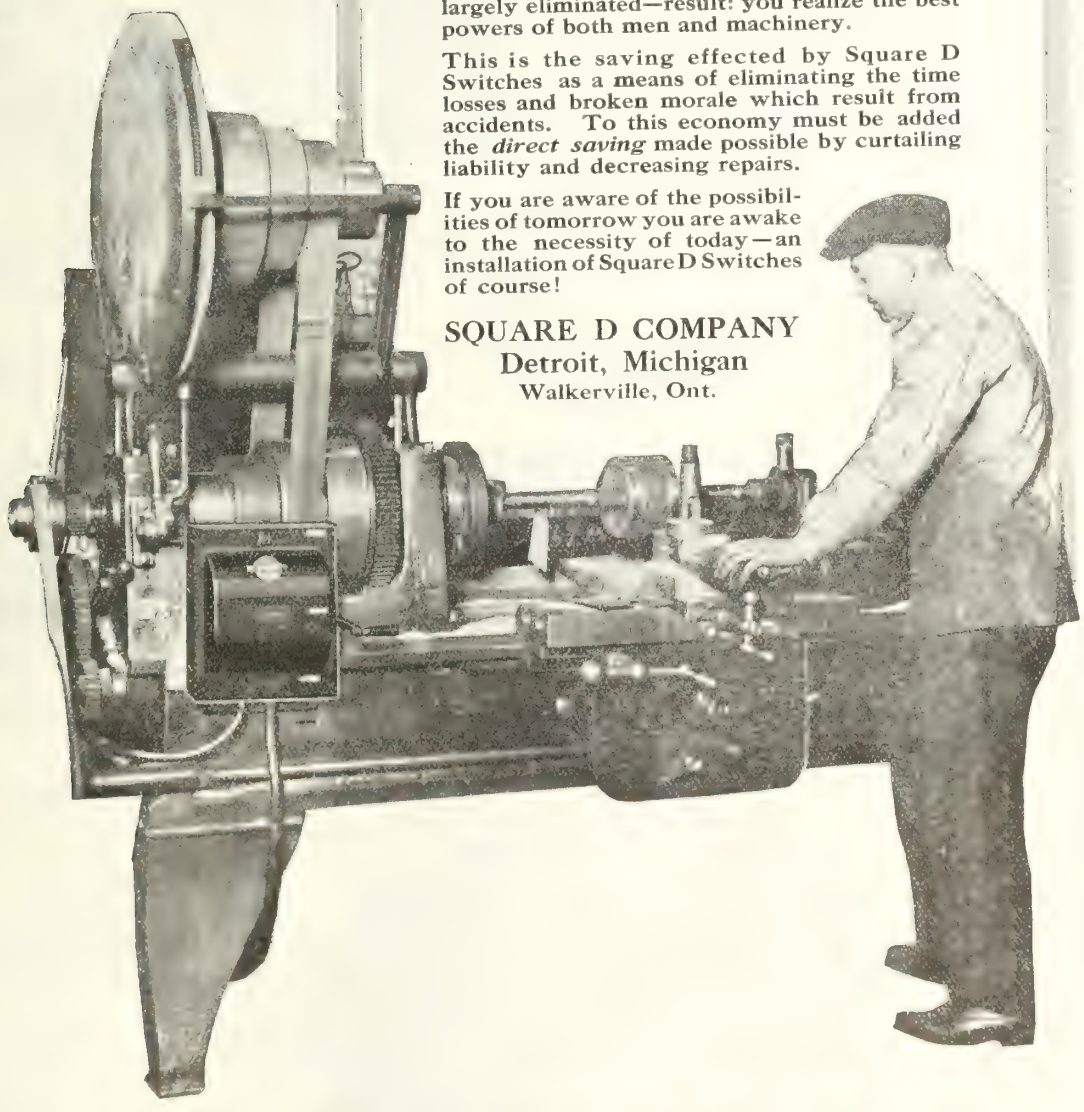
SQUARE D

SWITCHES

THE ORIGINAL SAFETY SWITCH

Production without Interruption



Only the machinery and men which *keep* producing can be classed as genuine assets.

When accidents to men and motors are reduced to the vanishing point by Square D Switches, the production-dwarfing delays which follow as an inevitable consequence of accidents, are largely eliminated—result: you realize the best powers of both men and machinery.

This is the saving effected by Square D Switches as a means of eliminating the time losses and broken morale which result from accidents. To this economy must be added the *direct saving* made possible by curtailing liability and decreasing repairs.

If you are aware of the possibilities of tomorrow you are awake to the necessity of today—an installation of Square D Switches of course!

A Vital Necessity in Every Industry

1500 lb. Gas Engine Cylinder cracked by frost and reclaimed by Oxy-Acetylene Welding

Over 80% of the material that appears to be only fit for scrap can be used over again practically equal to new by welding the parts together by the Oxy-Acetylene Process.

This not only means saving the actual cash value of the material reclaimed, but relieves the situation brought about by the excessive demand for metals of every description.

GROWTH—

Day after day, week after week, month after month, for the five years that Economy Fuses have been on the market, the sales have maintained a constant growth—not alone in volume, but also in percentage of increase. This is because

ECONOMY Renewable FUSES

are absolutely accurate in operation and cut annual fuse maintenance costs 80%. An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

The Chief Benefit

derived from

"No Spark"

CARBON BRUSHES

IS FREEDOM FROM TROUBLE REPLACING AND RESETTING BRUSHES. Being self-lubricating, they make the contacts practically frictionless and reduce commutator repairs enough to pay for themselves several times over. With these carbon brushes, the machine runs noiselessly without any sparking. These are facts which you can at once prove.

The Erico Bond Welder

The combined weight of the rheostat and furnace, which comprise the equipment of the

Erico Portable

is approximately 200 pounds, which enables easy removal from tracks insuring no holdup of traffic.

The outfit installs the standard **ERICO** rail bond, allowing no flame or arc to strike either rail or bond.

The Rheostat is especially adapted for arc welding purposes of all kinds.

We will be pleased to furnish full particulars upon request in regard to our very efficient equipment.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

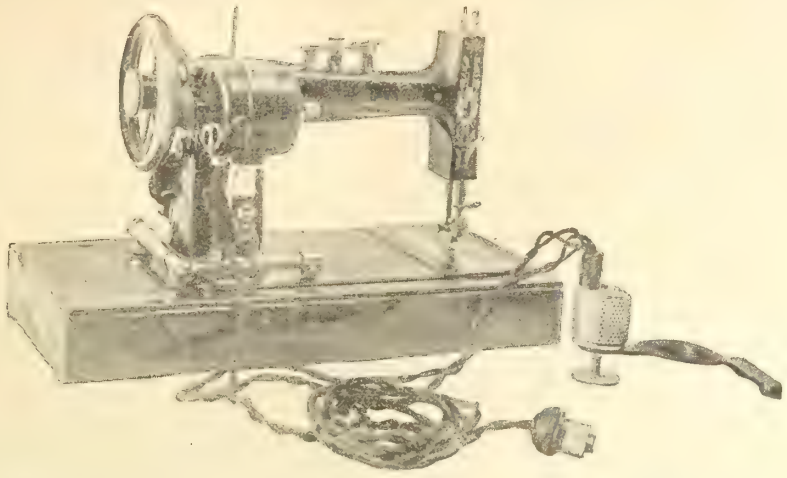
Best Known Cable Reel In Canada

THE demand for Northern Electric products and the fact that they are made by the largest manufacturers of bare and insulated wires and cables for electrical distribution is a positive assurance of quality.

They are as near perfection in both dependability and durability as experience, workmanship and superior materials, combined with the most modern machinery, can make them.



Bare copper, rubber covered and paper insulated, lead covered cables of Northern Electric manufacture—are designed by the most capable engineering skill and tested to ensure safety and efficiency to the fullest degree possible.

Our nearest House will be pleased to submit specifications and prices upon request.

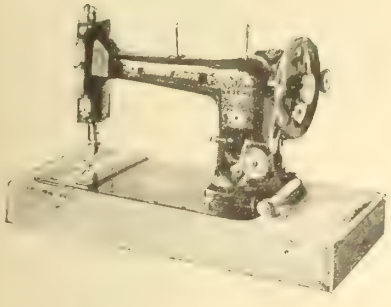
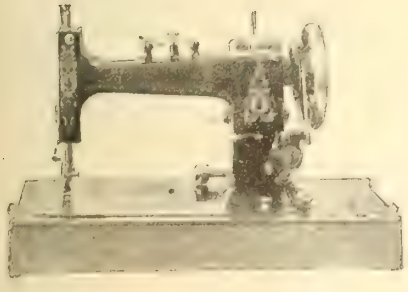
Every Woman Needs Its Help—Now



—but when the fall buying season comes, will you be ready?

Why Not Order a Good Supply of

Northern Electric



Portable Sewing Machines NOW?

Remember the greatest need for sewing by electricity is now, when the women of Canada are so extensively engaged in doing their own as well as a large amount of patriotic sewing work at home.

The Northern Electric Sewing Machine eliminates the tiresome, back-aching treadle work of the old method, and enables the operator to do twice as much sewing without effort.

The Northern Electric Sewing Machines are of the highest grade in design and workmanship, and carry a guarantee of complete satisfaction in every way.

Several different types are obtainable in both portable and stand style machines. You can secure either vibrating shuttle or bobbin type.

Lowest Installation Cost of any Metal Wiring System

No. 222

Two-Wire Metal Molding

NAT'S DEMONSTRATIONS—No. 5

is connected to the base of a Device by means of a Bushing—No.277—the design of which eliminates the necessity of using screws. Nat is showing you the first step in making this connection. Having removed the twistout, he has inserted the tongue of the base of the bushing into slot in the base of the Device, and is pushing the base of the Bushing into place. No. 279 Bushing, for connecting No. 333 Molding to these bases, is used in the same manner.

On your next job refer to your Bulletin 101 and place your order with your jobber.

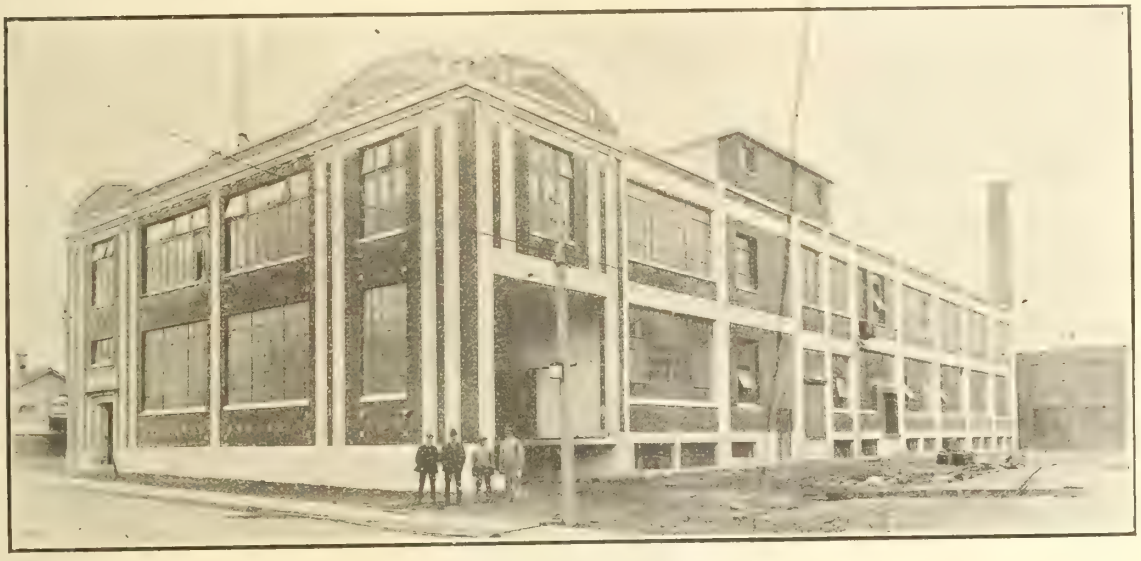
THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.



Bulletin No. 530 describes this instrument.

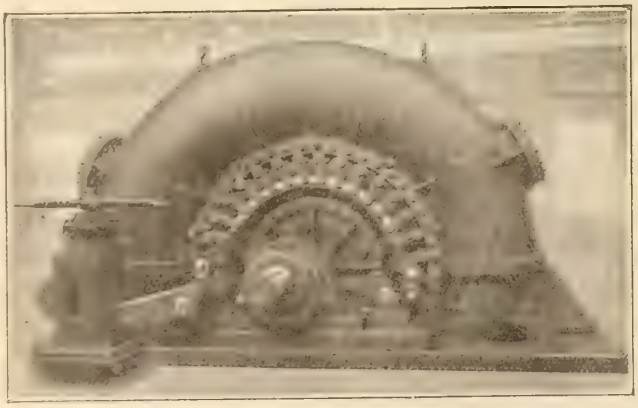
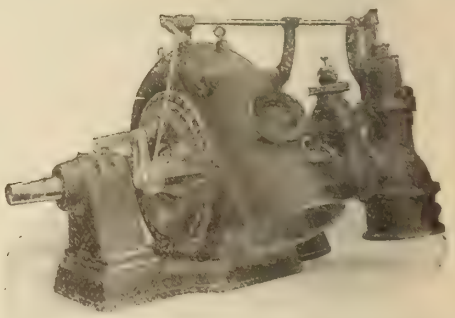
HYDRAULIC MACHINERY

We design and build water wheels of all sizes and types, either reaction or impulse, according to the conditions of the proposition, and we are in an unrivalled position to furnish HYDRO ELECTRIC POWER PLANTS complete in every detail. From a given head and volume of water, we are prepared to guarantee a definite electrical output.



Included in the accessory hydraulic machinery which we build are Oil Pressure Governors, Pressure Regulators, Relief Valves, Hydraulic Gate Valves and Butterfly Valves.



Monobloc cast iron runner for single vertical Turbine in concrete spiral casing, 6,000 h.p., 164 r.p.m., 70 ft.

Hydraulic oil pressure Governor, self contained, 25,000 foot pounds capacity.

Horizontal cast iron spiral casing, single discharge Turbine, 4,000 h.p., 250 r.p.m., 264 ft., driving eight pulp grinders.

High pressure spiral casing Turbine, single discharge, single runner, 2,700 h.p., 600 r.p.m., 310 ft.

A Natural Choice Where Quality Determines the Selection of Plant Equipment

In the plant which is equipped throughout with the most modern machinery, where every other consideration is subordinate to efficiency and maintained production, R & M Motors win the hearty approval of factory executive.

Their unfailing dependability keeps every machine always on the job and maintains production schedules.

As a result the first installation of R & M Motors in a factory is invariably followed by repeat orders when additional motors are needed. The distributor who sells them can always count on favorable consideration from every R & M motor user who is in need of extra equipment.

Distributors also find new motor prospects favorably inclined toward the R & M Motor. A decade of dominant advertising in the leading National Magazines has made R & M Quality known to nearly everyone—the new prospect as well as the experienced motor user.

Vol. 27 Toronto, September 1, 1918 No 17

A 55,000 Kw. Turbo-Alternator

The first turbo-alternator of 60,000 kv.a. capacity has recently been completed in the A.E.G. works, and the following description is abstracted in "The Electrician" from "Elektrotechnische Zeitschrift." The output of the machine is 55,000 kw., at a speed of 1,000 revs. per min. It gives 7,000 volts., three-phase, with excitation at 220 volts. The turbines work at a super-heat of 326°C., and with cooling water at 27°. The weight of the turbine is 250 tons, of which the turbine rotor is responsible for 49 tons; the total weight of the alternator is 225 tons and of its rotor 106 tons. The entire weight of the machine, turbine and alternator, is thus 475 tons. The machine utilizes two condensers, each of 3,000 sq. metre superficial area, and weighing 100 tons. The outlets leading to the turbines are 2,400 mm. in diameter.

The turbine utilizes 10 radial arms of 3,400-3,800 mm. diameter. This corresponds with a peripheral speed of 180-200 metres per sec. The blades must be made of steel without any nickel content, and the arms must, therefore, be worked entire. The alternator-rotor has an outer diameter of about 2,200 mm., which corresponds with a peripheral speed of 115 meters per sec. It was not necessary to construct the rotor, which, apart from the bearing, has a total length of 9 metres, out of one single piece, but it was built up by the assembly of a large number of plates from the same metal.

The speed of rotation at which the rotor was tested in the works was 50 per cent. above working speed, i.e., 1,500 revs. per min. With single plates tests were even made made at 2,000-2,400 revs. per min. The bearings of the machine have a diameter of 600 mm., which corresponds to a peripheral speed of about 47 metres per sec. In testing the machine at 50 per cent. above working speed great pains were taken, and likewise in a prolonged test of the turbine, designed to secure that the safety-regulator on the turbine shall forbid any possible excess of speed when the machine is in continuous use.

In accordance with the standard practice of the A. E. G. the machine is provided with three bearings, the centre bearing being a double one, in view of the size of the parts. Between the two inner bearings is the flanged coupling connecting the turbine-rotor to the alternator-rotor. The turbine house has no pedestal, but rests on the bearings on either side of it. It can thus expand, unhindered, to differences in temperature. Apart from mechanical strength, the design of the whole machine was so contrived, as a result of experiments on models, to give an imposing and constructive appearance, the round form of the turbine, indicating its function, being strongly emphasized. The machine, although the first of its kind, gives an impression of complete harmony in design.

This machine, together with a second one of similar size and output, also designed by B. Goldenburg, will be installed in the Rheinisch-Westfalisches Elektricitatswerke power station, located on the site of the coal fields at the foot of the hills near Cologne. The total installation at this station (named after the designer, the "Goldenburg-works") will consist ultimately of six turbo-alternators from 15,000 k.w. each up to about 200,000 kw.

Judicious Use of Electric Heat

The announcement is now definitely made that at various points in Canada the supply of anthracite coal is certain to be less than a year ago. This is a serious situation for those areas dependent upon the United States for their fuel and suggests the advisability of electric heating wherever possible. The power shortage, which again seems inevitable, around Christmas and the New Year particularly, renders the general employment of electric heaters impossible, but their judicious and patriotic use at off-peak periods could doubtless be arranged to eke out a scanty coal supply. In general the peak load of the year, as regards electricity supply, comes on, in Canada, a month or two before the most severe weather of February, so that at least this month's coal supply, and doubtless also that of March and April, might be supplemented by a little electric heating without interference with war industries. There are also certain limited periods each day in addition to Saturday afternoon and Sundays where the maximum demand on the central station is rarely maintained.

On this supposition it would appear to be well for householders in general to equip their homes with one or two small heaters, ascertain the hours at which these may be safely used and thus make a systematic effort to get along with the smaller coal allotment.

St. Lawrence River Power Co. Demands

The St. Lawrence River Power Company is making application to be allowed to construct an ice weir in the St. Lawrence River, between the Long Sault Islands and the canal which leads to Grass River. Under ordinary circumstances thirty days' notice is necessary for the hearing of an application but, as the company urged that this work was needed to increase the output of aluminium which, in turn, was to be used for war purposes, the rules were suspended and the hearing has been fixed for August 29 in Montreal. The matter was argued at a meeting of the International

[illegible] Commission held some ten days ago at Atlantic City.

The application will, it is understood, be opposed by [illegible] interests including the Commission of Conservation unless it can be shown definitely that the scheme will not interfere in any way with the natural flow of the St. Lawrence River. An important phase of the whole question seems to be that no one had been given an opportunity to study the plans at the time of the hearing in Atlantic City, and the number of days elapsing between that and August 29 is all too short for this purpose.

Saving Power by Inter-Connection

As a solution for the reduced supply of fuel and the greater demand for power, several companies in the New England States are considering a complete inter-connection of the plants in Eastern Massachusetts. The plan under consideration would probably save in the neighborhood of 70,000 tons of coal per annum and release about 50,000 kw. generating capacity for war work. The matter is in the hands of a conference committee of central station interests headed by C. L. Edgar, president of the Edison Electric Company of Boston. Representatives of the War Industries Board, the Massachusetts Gas and Elecric Light Commission and the Conservation Division of the United States Fuel Administration, have been in conference with representatives of the central stations and all are agreed that the plan could be made effective. It is estimated that by inter-connection, the fuel consumption in the plants involved, which are about seventeen in number, would be reduced from an average of 2.38 pounds per kw.h. to 1.93 pounds per kw.h. representing a direct saving of 40,000 tons of coal. The plan does not involve the discontinuance of any of the generating plants composing the complete system. Each plant will be required to operate for a portion of each year—the most economical plants running more continually, the inefficient plants being used for peak-load requirements. The quantity of power involved is in the neighborhood of 200,000 kw. It is anticipated that the work of inter-connecting these plants will be proceeded with immediately.

Turning Scattered Prospects Into Profitable Business

Mr. S. J. Halls, sales manager of the British Columbia Electric Railway Company at Victoria, B.C., recently took advantage of the Westinghouse company's standing offer for articles for "How-I-did-it" and secured a prize for his article "Turning Scattered Prospects into Profitable Business." Mr. Halls' article has some useful suggestions and we reproduce it:

I suppose most central station salesmen or district agents have at one time or another been up against the problem of having to deal with requests for lighting extensions to streets with very few residences on them.

We had a number of such cases some short time ago in a suburban municipality.

The capital expenditure necessary in pole line construction was out of proportion to the estimated revenue from the parties desiring service, and as the premises were very scattered it looked rather hopeless at the time to meet people's wishes.

However, we naturally wanted this business, if at all possible to obtain, and therefore cast around to find ways and means of satisfying those wishing connection from our lines, and at the same time to ensure profitable business of ourselves.

The young municipality, in which these scattered homes were situated, had not up to this time seen its way clear, even on a modest scale, to embark on a street lighting scheme. Now appeared to us the opportune time to start negotiations for a system to be installed.

We accordingliy interested those parties who wanted light in their homes on the thinly settled streets, that provided satisfactory arrangements could be entered into with the council for street lightning covering the whole municipality that then sufficient revenue would be derived, in conjunction with domestic lighting, to enable us to undertake the extensions desired.

The matter soon took definite shape. I appeared before the council and explained fully the circumstances, and pointed out how by mutually getting together all parties would benefit by the proposals. I also explained the nature and operation of a street series system and submitted costs of construction and operation of such a plant.

A committee was appointed to go carefully into the question, with the result that at the next regular council meeting I was asked to draft up and submit a contract covering the scheme. This embodied that the system (excluding poles) when paid for should become the property of the municipality; that we would extend the payments over a period of some years, and also give the privilege of using our poles for such street lighting, without charge, during the life of the contract. Current was to be paid for on a kw.h. basis the municipality to maintain lamps, renewals, etc. With a few minor changes the contract was duly signed and sealed.

The factory gave prompt delivery of the necessary apparatus, this consisting of one 22 kv.a. series tungsten regulator, which, together with 190 ornamental brackets, each supporting an 80-watt, 6.6 amp. lamp on ordinary streets, and 100-watt, lamps on main thoroughfares, were duly installed within a period of three months, and lights were turned on a few days before Christmas. This was particularly pleasing to the residents, coming as it did at the festive season.

We received some bouquets for our efforts in the matter. Incidentally it also greatly assisted in returning the whole council and councillors were all re-elected for another year by acclamation, thereby saving the voters some hundreds of dollars in election expenses.

With the subsequent introduction of the street series mazda "C" lamps, we recommended their adoption, this following the use of larger wattage lamps and substantially increasing the efficiency of the system, which has since been considerably extended.

The monthly bills for energy have been kept to within reasonable limits so that the general tax rate has never exceeded a quarter of a mill on the dollar to cover the entire operation of the street lighting system—a figure, needless to say, extremely gratifying to the taxpayers.

The result of these negotiations, of course, enabled us to go ahead and connect up all our scattered prospects with domestic lighting. It was also soon noticed that there was a distinct inclination on the part of the residents of the entire neighborhood to take a renewed interest in electric lighting in their homes, to the extent that tungsten lamp sales increased very appreciably, consumers no longer being satisfied with the old carbon lamps—they wanted something on a smaller scale to give them the efficient light now to be found on their streets.

Another point of interest attached to this bit of business was its relation to our street railway business, which operates in the municipality. In the past it had been necessary for the company to supply and maintain at its own expense certain lights at prominent and dangerous crossings.

With the advent of the general series system, this was no longer necessary, as all street corners on the car lines were provided with a brilliant light, so that passengers could board or alight with perfect comfort and safety.

Within six months of the above system going into op-

eration, two other adjoining districts, not to be outdone in the matter of street lighting, completed arrangements with us for practically similar installations, carrying almost identical benefits to those recorded.

In conclusion, therefore, what looked in the first place like some scattered business hardly worth picking up, by a little judicious handling brought us three suburban street lighting contracts, added considerable load to our residential circuits, increased tungsten lamp sales, and benefited the street railway.

Merely a Typical Case

A small manufacturer of concrete mixers had a tumble-down shack in which he had been producing three and a half concrete mixers a week. The natural lighting was insufficient so that artificial lighting had to be used practically the entire day and this consisted of naked lamps of small size suspended from extension cords.

An illuminating contractor was requested to light up one-half of the shop in a better way. This he did by installing overhead units in size and number so as to give a high intensity of illumination uniformly distributed and sufficiently diffused to avoid sharp shadows. After about three weeks the owner of the plant called him up and said: "Come out and fix up the other half of the plant. Due to improved lighting, I am now making five machines a week." This, in percentage, is a tremendous gain, and as no other changes had been made in the plant, it may be attributed almost entirely to the lighting.

Typical Accidents and Fires Attributable to Electrical Abuses

"Electrical Data" for July, the official publication of the National Board of Fire Underwriters, prints a number of interesting reports of accidents and fires attributed to electrical causes. It is noticeable that any one of these accidents might have been foreseen and avoided. However, the enumeration of them is valuable as indicating the necessity for caution with even this safest source of light, heat and power. A number of typical items are enumerated below:

Bath Rooom Fixture Easily Reached by Person in Bath Tub.

In preparing to take a bath the person stood with one foot in the bath tub which contained water, the other foot being on the floor. In this position she reached over to a bowl for soap and in drawing back came in contact with a fixture with the other hand. The fixture was a one-light combination gas and electric wall bracket, which, because of broken down insulation of conductors was electrically charged. She received a shock and a slight burn on the first finger of the right hand and fell to the floor receiving injuries to the right arm, side and leg. The potential of the circuit was 113 volts.

Enters Transformer House Through Window and is Killed.

In company with other boys, a boy seventeen years of age was bathing in the tailrace adjacent to the plant of a light and power company. While playing tag, this boy climbed up an abutment and through a window into a room in the plant containing high-voltage transformers. The boy's brother looked in at the window and noting that something was wrong, hurried to the engineer. From the marks upon the body it was apparent that the victim's head came in contact with the high-voltage wires. The transformer room was kept locked and the window was left open for ventilating purposes.

Taking Electric Iron Into Bath Tub.

The victim, aged 34, of this accident entered the bath room taking along an ordinary six-pound electric pressing iron. The iron he attached by the usual cord and plug to a lighting fixture. After filling the tub with water he stepped in, taking the iron with him. He received a shock, the cord and iron became water soaked and the victim called for help. Before the current could be shut off he was found to be dead.

The lighting system was 110-volt, alternating current with the secondary neutral permanently grounded, allowing no possibility for a higher voltage to ground. The lighting bracket was found bent down, due to efforts to pull the cord loose from the fixture, and the heating element of the iron was found to be burned out.

Boy Climbs High-Tension Wire Tower.

Three boys were playing at the foot of a tower supporting high-tension wires. One of the boys proposed a game of "stump the leader." At this, one of the boys climbed to the top of the tower, touched one of the wires and fell 40 ft. to the ground, dying from shock and burns.

Arc Lamp Supporting Chain Charged.

Two men in a buggy came to a railroad crossing. One of them alighted and approached the track to see if a train were coming. Placing a cigarette in his mouth, he walked over to a wooden pole at the crossing on which electric light wires were strung, reached out to scratch a match and at the same time touched a chain used in lowering and raising the arc lamp, also supported by the pole. The chain was charged and the man was killed.

Fire in Bedroom Started by Electric Iron.

An electric iron was used as a massage instrument and kept in the bedroom. The occupant neglected to disconnect the plug from the wall receptacle or from the iron, with the result that the bed and contents of the room were considerably damaged by fire.

Tenant Replaces Heating Cord with Ordinary Lamp Cord.

An electric pressing iron was properly installed with standard heater cord between the socket and iron. The cord becoming worn, the tenant of the building replaced the worn cord with ordinary lamp cord which soon short-circuited, causing a fire.

Electric Iron on Lighting Circuit.

An electric iron was disconnected by a wall switch, which also controlled the lighting of the room. The current had been turned off the iron at the switch, but a person coming into the room, turned the switch on and obtained no light because the lights were turned off at the socket. He neglected turning the switch to the "off" position.

Pennies Replace Blown Fuses

The key socket on a pendant cord became short-circuited because socket screws were not tightly set in place. The short-circuit burned along the pendant cord to a rosette and the burned cord and socket dropped to the floor. Upon investigation as to why the fuses on the circuit had not blown out, it was found that a few days before, the owner had had trouble with this circuit and 6-ampere fuses had blown. A workman from a local factory, called saying he would remedy the trouble, which he did by placing a penny back of each fuse.

Poor Connection of Attachment Plug to Cord.

Poor workmanship in connecting a cord to an attachment plug caused an arc which set fire to the insulation of the cord. The cord ran through decorations in a show window and the flame was carried to this point.

Lamp Cord Hung on Nail Over an Open Oil Barrel.

In an automobile garage a common lamp cord, somewhat worn, was hung on a nail. Just below this was an open oil barrel. Weak insulation, the nail assisting, caused an arc to be formed and pieces of the burning cord fell into the oil

burned, from which the fire communicated to the surrounding timbers.

Staple Cuts Through Lamp Cord Insulation.

Ordinary lamp cord was extended, for branch lighting purposes around the baseboard of a room and held in place by metal staples. A staple cut through the insulation of the cord and started a fire.

No. 18 Telephone Wire Used to Connect Porch Light

A No. 18 telephone wire was used to connect from a branch block to a receptacle for a light on the rear porch of a residence. The wire became short-circuited, seting fire to the weather-boarding.

Window Curtain in Contact with Incandescent Lamp Globe.

A tapestry window curtain was draped so as to be in contact with one of the lamps of a candelabra bracket fixture. The heat of the lamp ignited the curtain.

Hot Lamp Globe Causes $10,000 Fire.

A department store had woolen blankets stored in small bales. These were stacked on high shelving, and in moving the stock about a common lamp cord was used as a portable lead to an incandescent lamp. The cord was left lying in contact with and between the bales of blanets. To the cord was attached a lamp without a guard. The lamp was left in contact with the blankets, and a fire loss of $10,000 resulted.

Incandescent Lamp Used as a Clothes Hook.

A sixteen candlepower carbon lamp in a wall receptacle was used as a hook for clothing. The occupants of the building returning late in the evening found the rooms filled with smoke and the walls and floor somewhat burned.

Report on One-man Cars by the A. E. R. A. War Board Confirms its Superiority

The War Board of the American Electric Railway Association has submitted to the National War Labor Board a report on the development of modern one-man cars. The following has been abstracted from this report by Electric Traction:

The need of one-man cars has been brought about by the enormous increase in all operating costs and by the scarcity of platform labor, owing to the large number of men who have gone into the war or war industries. The average operating ratio has risen from 50 per cent. in 1912 to 72 per cent. in February, 1918.

It is estimated that 30,000 of these cars could be used advantageously. There have been built, however, only about 700 one-man cars of a modern approved type. The old shuttle car with the closed rear platform is a common type of the one-man car. The use of cars of this type is limited to minor service. For complete routes with light traffic a better type of car is usually employed. The equipment of these cars is also more complete and more modern, including mechanically operated devices and air brakes. Probably the most advantageous use of the one-man car is in congested districts of the larger cities where the limited service is sufficient to handle the traffic. Such use has proved feasible in cities of from 50,000 to 400,000 population.

The type of one-man car, suitable for this purpose, will seat about 35 passengers. By supplying about 50 per cent. more cars of this type, it is estimated that more seats will be provided for passengers with only about two-thirds of the usual number of platform men. The reduction in the weight of the cars displaced will, it is estimated, reduce the fuel consumption an amount proportionate to the reduction in weight. The one-man car is estimated at less than 400 lbs. per seat, while the cars displaced weigh from 700 to 1,200 lbs.

The safety equipment is defined as a combination of air brakes, air operated doors, air sanders and the deadman's handle of the electric controller. This equipment automatically insures, first: That the doors will not open until the car has come to a full stop. Second: That the car will not start until the doors are closed. Third: The power will go off, the brakes will apply instantaneously and the track will sand, the moment the operator of a moving car fails to bear down on the controller handle of the deadman type.

The saving in manual labor is, of course, considerable. Under certain assumed conditions of normal traffic, 1,140 door operations are required in 10 hours. Automatic doors alone, therefore save considerable labor. The saving in labor with air brake equipment is apparent. The number of movements saved in eliminating the starting and stopping bell-signal is enormous and worthy of saving both as to time and to labor, as is also the fare registering labor.

The best proof that "safety" cars need only one man is presented by the fact that nearly always these cars are making better, faster schedules than the two-men cars, which they replace. If the one-man car was appreciably slower, the railways would abandon its use, because of the loss in mileage, the slowing up of the service and the increased liability of congestion would wipe out any saving due to a smaller crew.

The superiority of the "safety" car is confirmed for a wide range of service by data included in the report, covering 10 cities ranging in population from 21,000 to 400,000. These figures should prove conclusively that one-man safety cars are amply able to meet a wide range of operating conditions, and that if they were applied wherever possible, there would be a saving of hundreds of thousands of tons of coal annually and a saving of several thousands of men.

From the figures and data included in the report, the following points are brought out: (1) That the one-man safety car is applicable to a wide range of electric railway conditions. (2) That the safety cars of new contsruction permit of enormous savings in fuel. (3) That all safety cars permit greatly increased service to the public while still permitting a large reduction in platform personnel. (4) That the safety car, because of the use of automatic devices, can be operated at a higher schedule speed by one man than an older style car can be operated by two men. (5) That the safety car fully justifies its name as the preventer of accidents through the inter-operation of control, brakes, doors, steps, sander and emergency brake. (6) That only the safety car's economies in operation and improvements in service have made it financially practicable to maintain railway service in small cities where short headways were a necessity and in larger cities where the shortage of labor has seriously impaired the ability to give adequate service even with but one man per car, as at Seattle and Tacoma. (7) That the safety car is preferred by the men themselves because it eliminates all manual labor and avoids division of responsibility with a second platform man. (8) That the safety car promotes better public relations in demonstrating the goodwill of the railway, thereby paving the way for a solution of the local utility problems. The modern one-man car now costs about $6,700.

In conclusion, it is pointed out that the rate of change or turnover of platform men is so great that no man has ever been deprived of work on the properties named, because of the introduction of the one-man car. The railways hope in fact that the elimination of manual labor on these cars will enable them to offer employment to a wider classification of men and to keep such men longer in the service.

Pay-as-you-enter cars are being installed on some of the lines of the Hamilton, Ont., street railway.

The Economic Electric and Manufacturing Company, Montreal, have registered.

Aerial Cable Construction for Electric Power Transmission

By E. B. Meyer*

Central station companies have had to meet a number of difficult problems during the past three years but the most important has been that of supplying enormous power demands imposed upon them. On account of the rapidity with which most of the materials covered by war contracts must be delivered, industrial companies found that the building of isolated plants was out of the question, not only because of the time necessary for erection, but because of the low rates and excellent service furnished by utility companies.

At the present time the central station engineer in dealing with the customer has to provide for thousands of kilowatts rather than hundreds, which were the usual demands

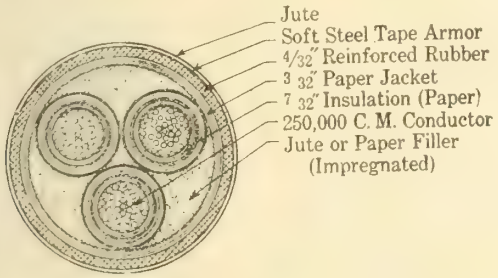

Fig. 1—Reinforced rubber-covered aerial cable.

previous to the war. These large demands have made it necessary to solve numerous operating problems in connection with the transmission system and to devise special methods of construction in order to serve the industries upon which the government is depending to help win the war.

The Public Service Electric Company, which operates in 200 municipalities throughout the State of New Jersey, supplies light and power to approximately 170 manufacturing plants engaged directly or indirectly on Government contracts. One of the special methods adopted by the Public Service Electric Company in meeting war time demands, was that of furnishing the customer with primary service by the use of aerial cable run on poles and supported by messenger wire, a type of construction similar to that used in telephone work. This type of construction was first used by the company about seven years ago when it was found necessary to connect two large generating stations through tie feeders.

The matter of running overhead wire was considered but found impracticable because the line in several places would have to cross freight yards, trestles, and bridges, and the owners of these structures objected to open-wire high-tension lines. Most of the section between these two stations was soil of a marshy character, through which it would have been impossible to run a duct line without the use of foundation piling. It was therefore concluded that the use of aerial cable furnished the most satisfactory solution of the problem. In this installation ordinary lead-covered cable of the same type as that for underground work was run on a pole line with 50-ft. pole spacing. To protect the sheath from mechanical injury there was applied a covering consisting of several layers of jute and marlin with an outer armor of soft steel tape.

Special Cable Designed.

The use of lead-covered cable for aerial work was found undesirable, however, because of the excessive weight of the cable and the fact that it could not be installed on standard pole line construction, and a special form of cable was developed to overcome these objections.

In Fig. 1 is shown the modified form of cable for 13,200-volt operation, which is made up with 7/32-in. paper conductor insulation, a 3/32-in. paper jacket and a 4/32-in. reinforced rubber covering over the paper jacket. The reinforced rubber covering is similar in construction to that of the ordinary garden hose, being made up of several piles of fabric and rubber. The entire cable is saturated with rubber compound and covered with tape and a weather-proof braid, thoroughly impregnated with a waterproofing compound. For mechanical protection, the whole core is encased in an armor made up of galvanized steel tape. The use of this form of construction reduces the weight of the cable approximately 50 per cent and permits the use of lighter pole line construction.

The process of manufacture of the reinforced rubber covering consists in calendering both sides of the cotton fabric, previously dried and waterproofed, with a 30 per cent Para rubber compound, so as to obtain a thorough filling of rubber, which, under the process of calendering, becomes partially vulcanized. The prepared fabric is then cut into tapes. These are applied to the electrical conductor in the usual manner, all contact surfaces and interstices being filled with a rubber cement. The insulated conductor is then dried under moderate heat. According to whether the reinforced rubber covering is applied over an insulating layer of rubber compound, or a layer of cambric or paper, the finished cable may or may not be subjected to vulcanization. In the latter case, the partial vulcanization of the rubber in the reinforced rubber is further advanced during the drying process and

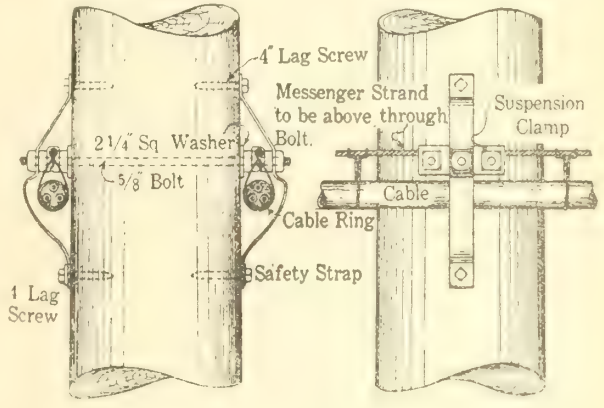

Fig. 2—Method of suspending messenger cable.

during leading in the case of leaded cables; otherwise further vulcanization takes place with aging and under service.

The finished material is perfectly homogeneous. Its specific insulating and dielectric constants are lower than those of rubber, paper and varnished cambric insulation, and for that reason, among others, it is preferable to combine a thickness of reinforced rubber with one of the other materials. By placing the reinforced rubber outside a thickness of a higher dielectric compound near the copper wire, the potential gradient is reduced so that the lower dielectric compound near the copper wire, the potential gradient is reduced so that the lower dielectric strength of the reinforced

* Before the A. I. E. E.

does not materially decrease the total dielectric strength of the cable.

Many engineers have been of the opinion that paper insulated cable with the reinforced rubber jacket would not give satisfactory service when subjected to the heat of the summer sun, but in spite of the fact that the cable is exposed to the elements throughout the year the Public Service Electric Company has never experienced a service interruption through the failure of any of the aerial cable in use in the transmission system.

The following table gives approximate weights and outside diameters of three conductor cables, insulated for 13,200 volt operation:

Approximate Weight and Diameter of Three-Conductor, 13,200 Volt Aerial Cable.

Size	Weight per foot pounds	Diameter Inches
No. 4	3.50	2.25
No. 2	4.05	2.41
No. 1	4.45	2.50
1/0	4.80	2.57
2/0	5.70	2.66
4/0	6.70	2.91
250,000 cm.	7.05	3.00
350,000 cm.	8.50	3.22

The principal advantage of aerial cable for tie feeder installations is that it makes little difference how many working lines are carried on a single pole line. Additional cable may be run, existing construction changed, transferred or repaired without taking out of service any line except the one on which the actual work is being done. Lightning discharges seem to have little effect because the messenger wire which carries the aerial cable is permanently grounded.

The usual aerial cable installation requires the use of Class B chestnut poles, with a normal spacing of from 90 to 100 ft. Where conditions make it necessary, sections as long as 150 feet are permissible, but in such cases the adjacent sections should not exceed 130 ft. Sections longer than 150 ft. should receive special attention, and Class A poles should be used on long sections and at points of special strain. The location and frequency of guys is largely dependent on local conditions and can, in most cases, be decided upon by a competent line superintendent.

Attention is called, however, to the fact that the stress at dead ends and corners is very great, frequently being as much as 25,000 lb. These points of special stress need to be well guyed. Both the anchors and the guys should be designed with a factor of safety so high that the messenger will fail before the pole will pull over. In all cases it will be necessary for guy stubs to be reinforced by an anchor guy.

For the suspension of the messenger a double ended 5/8-in. through bolt is recommended, as illustrated in Fig. 2. The use of a safety clamp is also desirable. This clamp serves the double purpose of reinforcing the through bolt and preventing the cable from falling to the ground in case the rings fail. Careful tests made on the method of suspension show that it will withstand the maximum loads to which it will be subjected.

The type of clamp used is similar to that used by the American Telephone and Telegraph Company, the size depending on the diameter of the messenger strand adopted. The clamp is designed expressly for construction of this character and is not built like a guy clamp which is designed to grip two strands instead of one. It affords a greater lever arm for the bolts to work upon in grasping the messenger and supports the messenger strand closer to the bolt, decreasing the bending moment on the bolt due to the weight of the cable.

The messenger strand should always be placed above the bolt in order that the weight of the cable will not be supported by the clamp. Various forms of cable rings may be used in supporting the cable on the messenger wire.

Where one or more cables are to be installed on a pole line they are usually in pairs, two from each through bolt. The messenger wire is extra strength 5/8-in., seven-strand, galvanized, steel wire. The wire composing the strand should be free from scale, inequalities, splints or other imperfections, not consistent with the best workmanship. It is usual in purchasing galvanized steel wire of this character to have it conform to a specification covering the galvanizing. This is necessary as otherwise inferior grade wire might be obtained.

Messenger Should be Drawn Tight.

It is very important that the messenger wire be drawn as tight as possible, in order to prevent sagging when subected to the weight of the transmission cable. If this is not done, an unsightly installation will result. After the messenger wire has been given its final pull and properly dead-ended, the placing of the aerial cable in the next step. In pulling the cable up to the messenger wire it is very important that precautions be exercised to prevent mechanical damage or excessive strains which would tend to weaken or damage the insulation.

It is customary in aerial installations to ground the messenger strand. Where the soil is dry or soil conditions unfavorable for grounding, a ground connection should be installed at every second pole. Where the earth is damp and soil conditions are favorable, a ground should be installed at every fourth pole. In marshy ground and in places where conditions are particularly favorable, a ground at every eighth pole will be sufficient. Where possible, this ground connection should be well bonded to some metallic subsurface structure. If this is not possible, the standard artificial pipe ground should be installed.

It is also desirable that the steel tape on the cable be banded to the messenger strand with bonding wire at every cable joint, as proper bonding is necessary in order to furnish the required protection against lightning. Where cable is run through trees and likely to be damaged by abrasion it should be protected by several layers of galvanized tape similar to that later described for use in protecting the joint.

In Fig. 3 is illustrated a method of clamping the cable to the messenger wire. On steep grades where the angle between the cable and the horizontal is greater than 30 deg. the use of such a cable clamp is recommended. This clamp can be made up as required and should be used on every fourth pole. It is designed to take the greater portion of the down hill pull on the cable, which otherwise would be carried by the cable rings.

In erecting the cable, the first reel is set up in the usual manner and the cable run off to the first pole, at which is placed a sheave of approximately 12 in. diameter, the top of the sheave being located about 5 in. below the messenger wire. On the four or five succeeding poles similar sheaves or cable rollers are placed, and in feeding out the cable 2.5-in. (6.35 cm.) "S" hooks, spaced 18 in. (45.6 cm.) apart, are fastened to it. These hooks are fastened to the cable with a small piece of marlin, made up in a loop knot, as illustrated in Fig. 4.

A line man is stationed at each pole to change the "S" hooks from one side of the pole to the other, which process is repeated until the entire length of cable has been installed in place.

The "S" hooks, which were used as a temporary support, are now removed and permanent rings put in place. This is done by a lineman supported on a boatswain's chair, which

is moved along the section supported by the messenger wire.

In running the transmission cable, either a motor truck, horses, hand or power winch may be used.

In the splicing of aerial cable, no special means are employed, but the usual precautions observed in the installation of underground cable must be followed. The jointing of any cable is more or less a matter of individual experience and great care must be exercised in all cases to exclude moisture. The work should be carefully done by a reliable and experienced workman and no splicing should be undertaken when weather conditions are unfavorable.

Each conductor of the cable is insulated with black bias-cut varnished cambric tape of a thickness of about 30 per cent. greater than the machine applied insulation. Between each layer of tape, varnished cambric insulating compound is applied. After the individual conductors have been insulated a jacket of bias-cut black cambric tape, well painted between layers with an insulating compound, is applied to a thickness of 4/32 in. Over the jacket of cambric tape several layers of the best grade rubber tape, 5/32 in. in thickness, are applied and painted between layers with a high-grade rubber compound. The completed joint is then covered with three or four layers of friction tape well painted with rubber compound. The joint is then ready for the application of a soft steel galvanized tape over which is finally applied an outer covering consisting of three or four layers of friction tape painted between the layers with a good grade of waterproof compound.

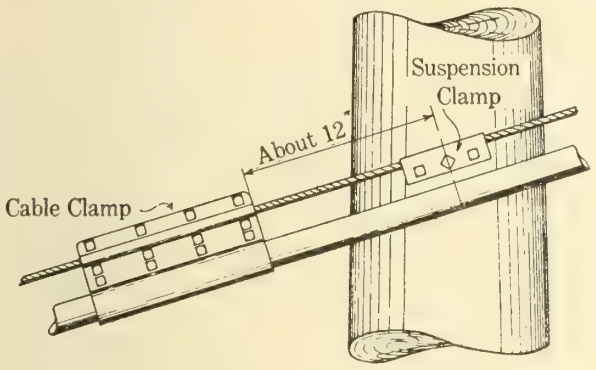

Fig. 3—Clamping cable to messenger on grade.

Where it is necessary to make connection from an aerial cable to an underground system a standard form of lead covered cable is used and installed in a lateral pipe. The joint between the underground and aerial cable is made up in the manner just described, and there is slipped over the joint a lead sleeve, one end of which is wiped to the lead-covered cable. The other end is well taped to prevent moisture from penetrating the cable.

While most of the existing circuits are operated at voltages under 15,000, the excellent results obtained with aerial cable has led the company to use this type of construction on all special work for operation at 26,000 volts.

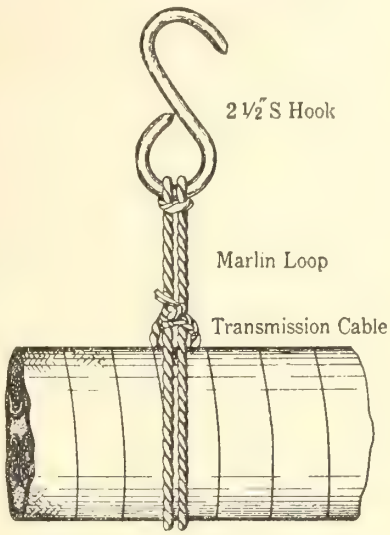
To keep the cable in good condition it is necessary to paint it every four or five years with some form of insulating paint. This serves to keep the outside jacket from disintegrating and protects it from the action of the elements.

There is in service in the various transmission lines of the company approximately 65,000 ft. of aerial cable operating at 13,200 volts and about 16,000 ft. either operating or in course of construction for 20,400-volt service.

It was impossible within this short length of time to obtain the standard aerial cable with reinforced rubber insulation, and it was found necessary to take ordinary lead covered cable out of stock.

The erection of lead covered cable by the methods commonly used in installing aerial cable, on account of the weight and long pole spacing, would have resulted in throwing too great a stress on the messenger wire and lead cable. It was, therefore, decided to use the catenary form of construction so as to reduce the strain, with the result that the transmission cable hangs perfectly level and without sag.

Aerial cable construction is somewhat more expensive than ordinary open wire construction, but its cost is less than that of an underground conduit system. As the costs of the various types are so largely dependent on local conditions, no comparative estimates will be given here. In general, the cost of an aerial cable is about midway underground and open wire construction.



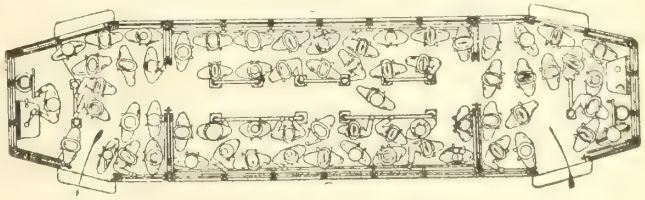


Fig. 4—Method of fastening hooks to aerial cable.

While this paper deals primarily with the use of reinforced rubber cables, there are numerous installations throughout the country where other forms of insulation have been used with satisfactory results.

Seatless Car Being Tried in Rome

On some of its routes the Rome (Italy) Tramways is experimenting with a number of seatless motor and trailer single-truck cars. These cars, as shown by the accompanying loading diagram, reproduced from the Electric Railway Journal, are of the inclosed type with bowed ends, and they accommodate as many as sixty-five passengers.

A seat-less car for rush hours.

Passengers enter at the rear and leave at the front, both on the near side. The rear platform accommodates seventeen persons, and the front one only thirteen, a space being chained off for the motorman. In the body of the car, separated by a series of hand rails, are three parrallel longitudinal aisles. The centre one is kept free for fare collection and passenger circulation.

The new cars are clearly marked on the vestibules at each end: "Standing Places Only." The company plans to try them for six months and watch the economic and social results. If there is no serious objection, the public authorities will permit the continuance of the seatless-car service and its extension as traffic demands require.

The Engineer's Opportunity—Present and Future

Just as the engineer has demonstrated his value in war time so, after the war, he will be one of the most important factors in the unprecedented race and development which most men believe inevitable. It behooves engineers in general then, to realize their importance and prepare for the days to come. Quite an interesting address along this line was recently delivered by Mr. S. A. Redding, superintendent of the local railway and power company before the student branch A. I. E. E., in the Georgia School of Technology. Some abstracts follow:

Judging from conditions as they exist in the world to-day, it requires only ordinary intelligence to comprehend in a general way what the future holds in store for the engineering profession, and particularly the younger engineers who are just starting out in business and have not fully made up their minds just what line of work to follow.

There never was a time in history when the engineer was in such demand as he is to-day, and will continue to be for many years to come.

When we stop to consider the enormous loss of life which has already occurred, and the additional loss which, unforately, is sure to follow; when we try to realize the almost inconceivable amount of property damage and destruction which has been wrought throughout Europe and on the high seas; and when we think of the enormous amounts of foodstuffs, munitions, machinery, and supplies of all kinds that are absolutely necessary in carrying on a struggle of such magnitude, it can be readily understood why young men are destined to take such a conspicuous part in the affairs of the world in the near future.

The value of any commodity is based on the law of supply and demand, and with the supply limited and the demand practically unlimited, the values of commodities are bound to be high. This law applies equally well to manual labor and all other forms of human effort; this being true, think of the enormous amount of reconstruction which will have to be done—reconstruction of work representing many years of hard labor and fabulous sums of money—railroads, bridges, highways, industrial plants of all kinds, and even entire cities in the boundaries of which are included every kind of construction imaginable; then, on the other hand, consider the available supply of raw material, the limited manufacturing facilities, the shortage of man power—skilled mechanics and artisans of all kinds as well as common labor —and you will readily conclude that it will be difficult to overrate the importance of the engineering profession when peace finally comes

Work Will be Plentiful.

Every branch of the engineering profession will be overrun with work, and while, from a purely money-making standpoint, there should be little to choose between the different branches, it is evident that one will most likely meet with the greatest measure of success by following the line of work in which he has the most decided talent.

The electrical and mechanical engineering fields will be very productive; the hydraulic and civil engineers will have their hands full; and the architect and textile engineer will also be in great demand.

From July 1914, when the war broke out, until we were finally forced to take a hand, the many electrical and mechanical manufacturing industries in the United States had been gradually changing over their existing plants and making new additions in order to take care of the requirements of the allies, but since our entry the requirements of our own governmetnt have been so great and so urgent that practically every manufacturing concern in the country has been loaded beyond its capacity with government orders of all kinds.

As a result of these emergency conditions, it is practically impossible for public utilities such as the telephone, electric light, power, street railway, and gas companies to secure promises of deliveries on equipment requirements in better than nine to twelve months, except where it can be conclusively shown that the equipment or material required is to be used in actual government production; and, on certain kinds of apparatus, quotations cannot be obtained at all. Furthermore, on account of the unsettled financial condition of the world since the war began, a great many of the public utility companies have been forced to steer close to shore in order to avoid financial disaster. The purchasing of much needed equipment has been held off just as long as possible in the hope that the war would end in a short while; and so, when it does finally end, there is going to be a big commercial drive which will tax the capacity of the manufacturing forces to the limit.

Since many of the manufacturing concerns have had to change over equipment and plant arrangements in order properly to handle the Government war orders, it will be necessary for them to undergo a second transformation in order efficiently and promptly to meet the needs of the public utility companies, the steam and electric railroads, and the thousands of other industrial enterprises in the United States and neutral countries, in addition to the urgent needs of the devastated countries of Europe. One might well hazard the guess that depreciation and the wear and tear on railway lines and rolling stock, and on the machinery and equipment, running continuously day and night, during the past three and a half years, in feverish efforts to keep pace with the needs of war, will far exceed in money value the actual destruction caused by the war itself, great as this amount must be.

The serious coal shortage which was experienced last winter, while due to a combination of unusual circumstances, was a near national calamity which our Government will not allow to recur if possible. Certain phases of a similar situation in the future can, of course, be obviated by storing up coal during the summer months; but while such a precautionary measure would take care of domestic requirements, some other means will have to be devised to safeguard the cities and communities dependent upon the steam central-station and the gas plant for their electric light, power, and fuel for manufacturing as well as domestic needs.

The Government, as well as the central-station management and the manufacturer very clearly see the urgent necessity for immediate action to relieve the situation permanently.

The Need for Water Power Development

The plan, which would be productive of the greatest relief in the shortest time, includes the general development of the numerous water-powers throughout the United States. The electric energy thus generated would be transmitted at high voltages to the cities, towns, and rural communities within a radius of 25 to 150 miles, the distance depending in large measure on the size of the development.

This plan of general water-power development, will, when put into effect, give great impetus to the movement already under way for a more general electrification of the great trunk lines all over the country. It is a well-known

fact that the steam locomotive is one of the most uneconomical types of steam apparatus in use, consuming about six pounds of coal per horse-power-hour as compared with the modern steam turbine which consumes less than one-third this amount.

In those sections of the country not favored with water powers, coal will continue to be the source of power; but it is quite probable that considerable attention and study will be given to the comparatively new practice of building the steam station at the mouth of the mine and transmitting the converted energy over high-tension lines to the centres of distribution, instead of hauling the equivalent amount of coal to the steam stations located in the cities and towns and other points remote from the mine. This scheme would release still more cars which would be available for the transportation of other commodities which, unlike coal, cannot be transformed and transmitted direct to their destinations. With the principal water-powers developed; with modern steam stations built at the mines throughout the country; with a large proportion of the trunk lines electrified; and with large government controlled coal depositories in every city throughout the country, filled during periods of light traffic, the solutions of the coal and transportation problems will be found.

Now, what has been said applies not only to our own country and the allies, but to practically every neutral country throughout the world; for while no single nation at war has supplied all the manufactured exports to all of these neutral countries, all of the belligerents together have, in the past, supplied practically all of the machinery and manufactured goods of all kinds, used by all of these neutrals. Surely, if we, right here in the heart of the industrial world, have been unable to secure much needed equipment, it does not stand to reason that the neutral countries have been able to do so. The probabilities are that they are as bad if not worse off than we are, so when the great struggle is over, Brazil, Argentina, Chile, Peru, Bolivia, and the smaller republics of South and Central America, and Spain, the only country of any size in Europe not participating in the war, will be pleading, along with the rest of the world, for machinery of all kinds and the engineers and skilled mechanics to make the installations.

The Use of High-Pressure and High-Temperature Steam in Large Power Stations*

By J. H. Shaw

THERE is little doubt that the majority of power station engineers have given attention to the efficient utilisation of steam at the lower ranges of temperature and pressure, and have been during the past few years considering the upper range. Here there is rather more scope for choice, but it appears that doubt exists as to whether it is the more economical to increase the temperature of the steam by superheating or to increase the range by the use of higher pressures and a moderate amount of superheat. This question has been shelved to a certain extent, owing to engineers being engaged on war work, and thus unable to give the necessary time and attention to developing plant suitable for the higher ranges.

An interesting plant has been installed by the British Thomson-Houston Company at their Rugby power-house, consisting of a B.T.H. turbine and a Babcock and Wilcox marine type boiler, capable of a normal evaporation of 18,000 lb. per hour with feed-water at 80 deg. Fah.—the working pressure being 350 lb. per square inch, the final temperature of the steam after passing the superheater 700 deg. Fah., and the test pressure of the boiler 525 lb. per square inch. Good results have been obtained from the combination, and an inspection of the machine after about a year's operation showed no undue signs of wear.

At the Carville power station, Newcastle-on-Tyne, the latest section of the boiler-house is designed for 275 lb. pressure, and at Glasgow the boiler pressure at the new works is to be 250 lb. per square inch.

Does It Pay?

A question that will appeal to all is "Will it pay?"

A good case can be made out for a jump to 600 lb. pressure with a total temperature of 700 deg. to 800 deg. Fah., but this will involve a considerable amount of development charges being borne by the undertaking or undertakings which are the first to adopt such a pressure. On the other hand, it appears that practically all designs of existing apparatus can be so modified as to admit of pressures of 350 lb. to 400 lb. per square inch. It would, therefore, seem that to increase the working range of steam without the development of new designs a pressure of 350 lb. can safely be adopted, and that if it is decided to increase the range the adoption of a pressure below this is akin to "hedging" the question.

When considering any results of tests on high-pressure or high-temperature steam generating plant, it is essential that the tests on the boiler side and the tests on the turbine side be studied separately; further, it must be remembered that any results obtained on an extra high-pressure boiler can be obtained, and considering the boiler apart from the economiser, surpassed on a similar and similarly equipped low-pressure boiler.

For a comparison between the cost of running a power station at 200 lb. pressure (gauge) and at a 350 lb. pressure, a schedule has been prepared. It is proposed to consider a riverside station, where the water is suitable for surface condensing. It is proposed to install 20,000 kilowatt sets, and coal is assumed to be within a reasonable distance; the cost of the coal, with a net calorific value of 10,000 therms per lb., is for the purpose of the schedule assumed to be 10s. per ton at the works. The incombustible contents of the coal would amount to 20 per cent. The average water temperature is taken to be 60 deg. Fah., and the vacuum 28.5 in., with the barometer at 30 in. The overall efficiency of the boiler-house plant is assumed to be 77.5 per cent., which should be obtained with modern boiler control.

Turbine makers are not all in accord as to the efficiency to be expected from turbines of the size under consideration when working on high pressures, and, in view of the difference between the view of experts, it will be advisable to look ahead and anticipate that the efficiencies of turbines of the size under consideration will be improved in the near future. For the purpose of the calculations a turbine ratio efficiency of 80 per cent. is assumed at both 200 lb. pressure and 350 lb. pressure with the steam superheated 150 deg. Fah. and a constant vacuum of 28.5 in. An alternator of 20,000 kilowatts capacity can no doubt be built to give an efficiency of 97 per cent, at unity power factor, thus making the turbo generator ratio efficiency $0.80 \times 0.97 = 77.6$ per cent.

* Before the Institution of Electrical Engineers.

Assuming bearing and other friction losses to absorb 2 per cent. the internal efficiency of the turbine will amount to 82 per cent.

Comparative Costs

The schedule shows the comparisons of coal, steam and heat consumptions for a 20,000-kilowatt machine running under the conditions mentioned, at 200 lb. and 350 lb. pressure by gauge at varying superheats; also at 500 lb. pressure absolute and 268 deg. Fah. superheat, at which pressure and superheat the total temperature will be 736.5 deg. Fah., which is about the maximum temperature at present recommended for the materials now being used in turbine construction. The schedule shows that the cost for coal when generating 175.2 million kilowatt-hours with a load factor of 100 per cent. will be £64,400 at the higher pressure—superheat 250 deg. Fah.—and £69,200 at the lower pressure with corresponding superheat. This is a saving of £4800 per 175.2 million kilowatt-hours, or 0.007d. per kilowatt-hour. Unfortunately, a load factor of 100 per cent. is impossible, and the conditions under which power stations are operated must be considered before even an approximate estimate of working costs can be arrived at.

To arrive at an estimated figure for the power stations under discussion, it is proposed to assume that the standing loss of the station designed for 200 lb. will be the same as a typical station—the Valley-road power station of the Bradford Corporation, i.e., 1583 lb. of coal per hour. It will be fair if the same basis is taken for the plant at 350 lb. pressure, with 8 per cent. added to the works standing loss representing roughly the higher temperature of the steam at the higher pressure. Standing losses must be approximately proportional to the top temperature, as this affects radiation, boiler exit losses, etc.

For a 20,000-kilowatt set the no-load consumption will be approximately 22,000 lb. of steam, or 3666 lb. of coal per hour, and the total steam consumption at any load is 22,000 lb. + 9.54 lb. of steam per kilowatt-hour for the plant operating at 200 lb. pressure, and 22,000 lb. + 8.6 lb. of steam per kilowatt-hour and 3729 lb. + 1.45 lb. of coal per kilowatt-hour for the plant operating at 350 lb. pressure and 250 deg. superheat.

In order to allow for changing over, for the period when two or more machines are temporarily running together at partial loads, for reduced efficiency, in the boiler-house due to adverse circumstances, and for the necessity of sometimes running the plant when it is not in the best condition, it will be advisable to add 5 per cent. to the figures obtained for the load consumption and 5 per cent. to the no-load loss of the turbine, thus making the consumptions and costs as below:

Table I:

	Maximum load of 20,000 kilowatts and 50 per cent. load factor 87.6 x 10^6 units per annum.	
	200 lb. pressure, 250 deg. superheat, 28.5in. vacuum.	350 lb. pressure 250 deg. superheat, 28.5in. vacuum.
Works standing loss in tons of coal	6,200	6,700
No-load consumption of turbo-generators in tons of coal.....	15,100	15,314
Load consumption of turbo-generators in tons of coal	65,300	59,867
Total	86,600	81,881
Lb. of coal per unit on station bus-bars	2.211	2.094
Total cost at 10s. per ton	£43,300	£40,940
Cost of coal per unit	0.119d.	0.1122d.

The foregoing relates only to the cost of coal; the remaining items which make up the total works costs are not likely to be affected by the use of higher pressures and temperatures. Oil, waste, and water are practically unaffected; repairs and maintenance may be increased, but not to an appreciable extent. The capital cost of the plant is an item that may be affected to a considerable extent, but, unfortunately, the increased cost of turbines, boilers, pipes, etc., due to the use of higher pressures and temperatures cannot be given in a paper of this description. Table II. below gives the steam consumption on the conditions specified:

Table II.

Steam pressure at turbine lb per square inch ab.	215	265	315
Total temperature of steam at turbine, deg. Fah.	688	688	688
Superheat at turbine, deg. Fah...	300	281.6	265.6
Total heat of steam (from 32 32 deg. Fah.) therms per lb. ..	1371.3	1368.6	1365.9
Absolute pressure at turbine exhaust, inches (Hg.).....	1.5	1.5	1.5
Heat drop per lb. of steam, therms	429.2	440.3	449.1
Ratio efficiency of turbine and alternator	79.5%	79.1%	79.0%
Steam consumption of turbine, lb. per kilowatt-hour	10.023	9.82	9.65
Total steam consumption of turbine, lb. per hour	200,460	196,400	193,030
Steam consumption per effective kilowatt-hour, lb.	10.3	10.10	9.94

With regard to the practical difficulties, it is but to be expected that before pressures of 500 lb. or 600 lb. per square inch are adopted, a radical departure will have to be made in present boiler construction. All square boxes and headers will be eliminated, the drums and tubes will be smaller in diameter, and the design of the boiler made more elastic. The type of boiler will no doubt assume the appearance of a flash boiler, with practically no steam or water reserve, and fired by gas on the surface-combustion principle.

For more moderate pressures, up to 350 lb. per square inch, the existing type of boiler can be modified and successfully used. At Carville power station, Babcock and Wilcox marine-type boilers are being used, at 275 lb. per square inch gauge pressure, and at the British Thomson-Houston Company's works at Rugby a Babcock and Wilcox boiler is installed and successfully working at 350 lb. per square inch. Further, Messrs. Babcock and Wilcox state that they have at present two boilers on order for a working pressure of 475 lb. per square inch with steam superheated to a final temperature of 700 deg. Fah., and that they are quite prepared to supply boilers in their ordinary business for such pressure and superheat.

With higher steam pressures the temperature of saturation is raised, and, due to this, greater care must be exercised in the quality of the water used for the boiler feed. A feed-water that is perfectly satisfactory at 380 deg. Fah. in a modern tubular boiler might be quite unsuitable for use in a flash boiler. The quantity of air, CO_2, and oxygen will have to be kept down to a minimum, and also the non-soluble salts which are generally in the water discharged from an ordinary lime-soda water softener. A natural development, and one which is already taking place, is to heat the feed-water under atmospheric pressure by means of live or exhaust steam in order to drive off the entrapped and dissolved gases as much as possible. According to Lunge's "Technical Chemist's Handbook," it is necessary to raise the temperature of the water to 100 deg. Cent. before the quantity of air in the water is appreciably reduced.

The source of water for use in high-pressure plants will have to be carefully traced, and the treatment of the water should be such that minimum of unsoluble salts remains in it after treatment. The purer the water the greater affinity it has for air, CO_2, and oxygen, and every care should be taken that it is not exposed to the air between the con-

denser and the boiler. In order to avoid such exposure to the air it is suggested that the feed pump should be an extension of the condensate pump and the condensed water pumped direct into the feed line.

For Higher Pressures.

The natural development of the turbine for higher pressures appears to be in a line with Parsons two-cylinder machine, with a flexible claw-type coupling between the cylinders and a thrust bearing for each cylinder. For very large sets, above 50,000 kilowatts, the cross-compound turbo-generator will no doubt be used, the high-pressure turbine being attached to a generator and the low pressure turbine to another generator. Each set can then be run at its most suitable speed, with resulting high efficiency. This arrangement will no doubt lead to re-heating the steam after it leaves the high-pressure turbine and before entering the low-pressure machine. Dr. Ferranti has already done valuable work on this subject the results of which have unfortunately not been published.

The design of the condensing plant is not likely to be modified because of the use of high pressure or high temperature steam, but it must not be lost sight of, that with steam initially at the same temperature, but at different pressures the plant using the high-pressure steam will reject less heat units to the condenser per lb. of steam used in the turbine.

The steam pipes to be used in a station where both high pressures and high temperatures are employed will have to be very carefully designed. The question of expansion at higher temperatures will be of the utmost importance. For example, take the case of a steam pipe 100 ft. in length, and assume that the pipe had been erected at 60 deg. Fah. It will be found that a temperature of 388 deg. Fah., equal to steam at 200 lb. gauge saturated, the expansion is 2.59 in., while at 786.6 deg. Fah., equal to steam at 600 lb. pressure and 300 deg. Fah. superheat, the expansion is 5.75 in.

The expansion given can be readily taken care of if the designer can ensure that the expansion would always take place lengthwise in the pipe range. Unfortunately, taking a boiler off a range will cause a considerable cross-strain to the main header, due to the connecting pipes cooling down and contracting.

It appears that the main steam connections of the boiler will have to be designed in a flexible manner, in order to relieve the main range of stress. Further, these connections should be of the manifold or header type, i.e., made up of many small pipe connections.

From inquiries, it is apparent that the boiler mounting and valve makers are quite alive to the possibilities of high-pressure and high-temperature steam coming into commercial use. The question of the use of higher pressures is quite appreciated by the makers of economisers, who are prepared to manufacture economisers for 350 lb. boiler pressure or higher, either of their standard design, with the details modified, or of a design suitable for use as an integral part of the boiler, if necessary with horiontal and mild steel tubes.

It must be admitted that in order to attain a higher overall efficiency, it is necessary to increase both the pressure and the temperature of the steam. An increase of pressure with a constant temperature would mean that the dew point is carried further up the turbine towards the high-pressure end, thus tending to accelerate blade erosion in the lower stages and a reduced stage efficiency of the turbine. Also the high-pressure blading of a turbine is considerably less efficient than the low pressure stages, and although the losses in the high-pressure end are partly recovered in the low-pressure blades, it is apparent that to assume that a turbine for extra high pressures can be built with the same efficiency as one for a lower pressure—within limits—is taking a hopeful view, and that there is justification for hesitation before adopting extra high pressures on the part of managers responsible for the financial results of large undertakings.

Women Conductors a Success in Baltimore

The first women conductors to be employed by the United Railways & Electric Company, of Baltimore, Md., commenced their new work on July 10, and since that time have taken to their duties so earnestly, and the public has taken to this innovation so naturally, that there appears to be no question but that they will be an unqualified success in holding the places of the soldier and sailor boys until the war is won and the "warriors" return to resume their old platform position.

There was not a large number—just half a dozen—in the first little squad that was graduated from the training school at Park Terminal, where the intricacies of their new profession had been explained and its principles expounded. This first installment of women conductors was placed on the vestibuled P. A. Y. E. cars of the St. Paul Street and Boulevard lines, and the number has been gradually added to until there were 15 on the cars July 19, and more to go into service shortly.

The reception of women conductors by the Balitmore public was similarly gratifying. There may have been in some quarters a disposition to feel that, while women had succeeded in this calling in other large cities here and abroad, there might be a difference in Baltimore—a southern city. If there was a difference in the reception given the women, it was a difference on the side of respect and hearty co-operation from the patrons of the cars and the press of the city.

The women conductors are to fill vacancies only and not to replace men except when the latter leave the service, their employment being strictly a war measure with the United Railway. They are to be paid the same scale of wages as the men—35c an hour the first year with an increase as the of one cent an hour each year of service. They are guaranteed a minimum wage of $75 a month (under the old scale of wages.)

The first day in service of the company the women devoted their efforts entirely to the mastery of opening and closing the doors, collecting fares and making change, while the punching of transfers and the calling of streets was done by the male conductor.—Electric Traction.

Permanent Electrical Dining Room Display in the New London Hydro Building

The Dealer and Contractor

Electrical Interests will Gather in Toronto on Oct. 14, 15 and 16 to Hear W. L. Goodwin and Discuss his Plans for Closer Co-operation and Co-ordination of the Entire Industry

Local arrangements have now been made for the meeting of the National Executive Committee of the National Association of Electrical Contractors and Dealers in Toronto on Monday, Tuesday and Wednesday, October 14, 15, 16. The meeting will be held at the King Edward Hotel, Toronto, and will be open to all branches of the industry. Members of the committee include: W. Creighton Peet, New York City; E. McCleary, Detroit; Harry C. Brown, New York City; W. K. Tuohey, Springfield; M. E. Arnold, Phildaelphia; G. M. Chapman, Waterbury; T. H. McKinney, Atlanta; P. H. Jaehnig, Newark; G. M. Sanborn, Indianapolis; J. N. Pierce, Chicago; J. A. Fowler, Memphis; Robley S. Stearnes, New Orleans; W. I. Gray, Minneapolis; J. F. NePage, Seattle; Sam. Jaggar, Portland; M. G. Buchan, Cleveland and Fred B. Adam, St. Louis.

The biggest event in connection with this meeting will be the presence of Mr. W. L. Goodwin, of the General Electric Company, Schenectady. At a dinner to be held on Monday night at the King Edward Hotel, Mr. Goodwin will explain his now famous plan of co-ordinating the various elements in the electrical industry, having in view better merchandising, better general conditions and a greatly extended use of electricity and electrical appliances of every kind. It is expected that this dinner will be attended by every electrical man in Toronto and that large numbers will also come in from outlying points. The president of the Toronto Electrical Contractors' Association, Mr. Kenneth A. McIntyre, and his executive committee, have the whole programme in hand and may be depended upon to see that everything is in readiness when Mr. Goodwin arrives. There is no question at the present time quite so important to the electrical industry in general as that which Mr. Goodwin comes to propound, and we have every reason to hope that the Canadian industry will profit in the near future from the application of his policy, just as benefits are being reaped already in the United States.

Every electrical man, whether manufacturer, jobber, dealer or contractor, is urged to keep these three dates available for close attention on this convention. The larger the attendance and the more fully the whole matter is discussed, just in this proportion will the immediate results be noticeable.

Reservations for the banquet may be made at any time with Mr. Kenneth A. McIntyre, 72 Victoria Street, Toronto.

The Moloney Electric Co. of Canada are extending their Toronto office space owing to rapid expansion of business, and their address now reads 1221-24 Traders Bank Building, Toronto. Mr. Geo. D. Laycock, sales manger of the company, has charge of this office.

Beattie-McIntyre, Limited.

It is announced that Mr. Geo. J. Beattie, of the Electric Shop, 72 Victoria Street, Toronto, and Mr. Kenneth A. McIntyre, electrical engineer and contractor, Excelsior Life Building, Toronto, have formed a partnership under the name of Beattie-McIntyre, Limited. The headquarters of the new firm will be at 72 Victoria Street, and the field covered will include contracting, electrical engineering, power apparatus, labor-saving devices, illumination, etc. Mr. McIntyre will specialize on construction and Mr. Beattie will pay special attention to the commercial end.

Both of these names are very well known in the electrical field and the combination of two such experienced and competent heads into one business partnership gives this firm facilities for performing the very highest class of work over a very varied field. There can be little doubt that great success will attend their efforts.

Beattie-McIntyre, Limited, have a fine exhibit at Booth 88—the old Hydro stand—Industrial Wing No. 3, Process Building, Canadian National Exhibition, and extend a hearty invitation to visitors to look in on them.

A New Compensarc.

To give the close regulation of current essential for Mazda motion picture projection lamps, the Canadian General Electric Company are offering a new compensarc which provides protection against over current and regulation to within 1/100 ampere is obtained. It operates on the reactance principle and is furnished for standard a.c. voltages and frequencies in ratings of 20 and 30 amperes, corresponding to the Mazda lamps now on the market for this purpose. This compensarc is made up of a two-coil auto-transformer stacked with standard transformer punchings within a rawhide housing, the complete wiring of which forms the line side with the lamp terminals tapped across one coil. The coils are stacked so that room is left between them for an iron leakage plug in each side of the magnetic circuit. Turning a hand wheel on the shaft of the iron plug moves it in and out between the two coils, giving a very close adjustment for the lamp. Maximum reactance is obtained when the plug is all the way in. The only noise is a slight humming when the plugs are being withdrawn; this ceases when they come to rest.

Conductorettes on the motor bus and tramway systems in London, England, recently went on strike, completely tieing up both systems. The women claimed (and obtained) five shillings a week as a war bonus, the same as was recently granted to the men.

The building of steel ships without rivets is being accomplished in England and the United States by the use of electric welding. It is claimed that a saving of from 20 to 25 per cent. in time and material is possible by this method.

Why a Thorough Study of Selling Prices is Important

By J. E. Bullard*

Many a sale has been lost because the right price was not marked on the goods. The right price may have been lower or it may have been higher than the price marked. Time after time it has been found that a higher price will sell goods that cannot be sold for the price at which they were originally offered. There are also certain odd prices and there are quantity offers for different denominations of money that result in large sales.

Department stores have made such prices as 4, 9, 19, 23, 39, 98 cents and other odd prices quite famous. In fact the success of these large stores is no doubt due to a very great extent to the skill displayed in setting prices. The prices are not always low. In fact it is not low prices that are striven after so much as the prices that will appeal to the customers, the prices that in themselves will result in a desire to possess the goods. Even the automobile manufacturers have adopted the odd price method in selling their product to a rather remarkable degree. There are cars which have been or are selling for $360, $395, $995, $1,050, $1,450, $,1550, $1,-650, $1,950, $2,075, and various other odd prices, but there are few if any on the market that sell for an even $400, $1,000, $1,500, or $2,000. Apparently it has been considered easier to sell these machines at odd prices than at even prices even though their selling prices are comparatively high. Mail order houses also make a liberal use of odd prices. Even prices being used in such a manner as to make the odd prices more prominent results in people getting an exaggerated idea of the bargains the house has to offer.

Don't Use Too Many Odd Prices.

Too great a use of odd prices, however, may prove detrimental. Judgment must be used. The man who fixes the retail prices of any establishment has a job on his hands that is not dissimilar to the work of an artist. Just as the artist must select his colors and apply them to the canvas in such a way as to create a pleasing impression, the man who fixes the retail prices of a store must select them and apply them to the goods in such a way as to create a favorable impression upon the customers. The prices must give an impression of good values, but at the same time convey the idea that quality is not unduly sacrified to price. This is something that cannot be done without a great deal of study on the part of the price maker. He must study his goods, his prospective customers, the way other dealers in his and other lines do it in his vicinity and most of all he must be sure that he knows just the kind of effect he wishes to create and work towards that end.

If a store is catering to an exclusive set of customers, people who have large incomes and aristocratic tendencies, the prices determined upon and the setting given these goods would be radically different from the case where the middle class of people is being appealed to, and both these classes would have to be treated in a different manner from the case of laboring classes.

The aristocratic person wants everything to look expensive and exclusive. He wants to see expensive fixtures in the store; he likes to be admitted by a doorman in livery; he wants expensive service throughout and unless all this is included in the selling price, unless he pays very high prices for his goods, he is more than likely to suspect that the quality of the goods purchased is not up to standard. The result is almost bound to be dissatisfaction.

Department Stores and Mail Order Houses Have Studied Price Making.

There is probably no class of retailers which appeals to as many classes and types of people as do the department stores and the mail order houses. Through experience and study these institutions are often able to make the mere prices at which the goods are sold go a long way towards creating sales. It is these institutions that cater in a big way to the middle and laboring classes and it is their methods that are worth very serious study. All their methods may not be sound. Some of their methods could not successfully be applied to other businesses, but a study of them will prove of value to any business man. It will help him in solving many of the problems in his own business and may make it possible to sell a great deal more than could otherwise be sold.

Just at this time it is more than ever necessary that a great deal of attention be paid to the proper making of retail prices. At present odd prices are also more popular than ever before. If an article can be sold at a very narrow margin for 5c that is not a necessary reason why 5c should be fixed as the sale price. It is quite possible that the demand will be greater at 6c than at 5c. The 6c price indicates to the public that the article is of pre-war quality but that its sale price has been revised to war conditions, while a 5c price for the same article in addition to seriously cutting into the profit of the dealer might lead the public to suspect that there was something wrong.

The Public Affected by Impressions Rather Than Logic.

The general public is prone to be affected by impressions as much as by logic. It is the first impression that the price makes upon them that attracts from the business house. How little many people rely upon reason is illustrated by the following case:

A woman sent her little daughter over to the butcher store some years ago when meat was selling at retail for less than it is now selling at wholesale, to learn the price of round steak. The butcher sent back a note stating that it was selling for 12c a pound. Soon the little girl came back with a note from her mother stating that she would buy some steak if she could get two pounds for a quarter. Often when articles sell for 8c each people will insist on buying three of them for a quarter.

This being true it would seem wise to avoid, in so far as possible, setting prices of 8c and 12c on items that people will likely buy in quantites of two, three or more. The sales are pretty sure to be greater if the prices are set at 9c and 13c with the privilege of three or two for twenty-five cents. This will avoid all chance of embarrassment on the part of those customers who are poor arithmeticians. It will also yield a greater profit to the dealer and will probably increase the volume of sales because the better arithmeticians will purchase in larger quantities in order to save a few pennies.

How a Price Too Low Affects Sales.

Experiments have been tried that show prices too low affect sales. Many a mail order house has placed in its catalog an article marked at a real bargain price only to find that it did not sell. The only reason to be found appeared to be that the price was too low, that the price was so low indeed that the customers doubted the quality. By moving the price up and down one would eventually be found which would result in creating a big demand. This price would be

* Before the recent Convention of the N. E. C. A.

considerably higher than the one at which the goods were originally offered. It has been demonstrated time and time again that there is always a price below which it is not possible to go and give the public a reason that people will believe.

Years ago a couple of young men opened a cash provision store in which every article was sold for cash. It was in the early days of the cash store, and since these men had no bad accounts on their books, turned their stock many times a year and had a low overhead they were able to sell goods at a considerably lower price than were any of the credit stores in town. It was for these reasons that they could sell beans profitably for six cents a quart while all the other stores were selling them for ten cents. Samples of these beans were on display and were plainly marked at six cents a quart. Any customer had the privilege of carefully examining them. A little observation, however, soon showed that only the poorest class of people were buying beans in this store. The better classes might buy their salt pork, on which the saving was not so great, but only the poorer classes purchased beans. As an experiment two display cases at the front of the counter were filled with the same beans. One was marked six cents a quart. The other was marked eight cents a quart. The result was that thereafter the better classes of people began to buy their beans here. The poorer classes paid six cents because they were buying on price alone. They wanted the cheapest regardless of quality. The better classes purchased because it seemed reasonable that this concern could undersell their competitors by as much as two cents a quart. It did not seem reasonable to expect that they could undersell by as much as four cents. They, therefore, paid eight cents for their beans.

A Low Bid Does Not Always Get the Job.

There are many electrical contractors who rarely get big and profitable jobs because in their anxiety to get the business they have shaved their figures so low that those in charge of letting the job fear that work which will come up to the specifications cannot be done at the price. Successful contractor after successful contractor will say that if they relied upon low prices alone to get business they would not be able to make a living. They claim that it is the quality of their work that creates new customers for them. It is more than possible, however, that should these same contractors make a bid on a job at a price very much below the price current for quality work they would be given an opportunity to revise their figures before the job would be given to them. In some cases so much suspicion might be aroused by the low price that the bid would be thrown out altogether.

Every reasonable person knows that no business man can remain in business unless he is doing business at a profit. If below cost prices are featured everyone knows that the loss must be made up in some other way. The result may mean greater cost to the public than would have been the case if a reasonable price had been paid for the first articles or service. As time goes on people come more and more to realize this. It is necessary, therefore, to have much better reasons for low prices than for high prices. High prices, in themselves, imply quality. In any case it is apparent that there is no "nigger in the wood-pile" who is going to come out and rob the customer in some other way and not nearly as much suspicion will be aroused as would be the case if the prices were too low.

Public Utility Companies Should Not Cut Prices.

That public utility companies have made a very serious mistake in selling appliances at less than cost, as many a gas and many an electric lighting company has done, is evidenced by the fact that those which have maintained a seasonable retail price are to-day enjoying far greater good will than those which have sold their appliances at prices so low that it was impossible for any dealer to compete with them on a price basis. Those central stations that have been selling appliances at less than cost and which to-day find it necessary to increase their rates are far more likely to meet with bitter opposition from the public than those which have been maintaining their sales department on a strictly business basis and making it pay its own way.

Department stores are coming more and more to realize that it is not good policy to make big cuts in prices in advertised goods. If the cut is too great it has a detrimental rather than a good effect upon the good will of the customers. It is for this reason that many a store explains why it can sell these goods for less money than their advertised prices. To-day a cash basis of doing business is given as an explanation of low prices. It is a logical one and makes it possible for the dealer to offer lower prices than would otherwise be acceptable.

Cut Prices Are Not Necessary.

There are many dealers who consider it essential to cut prices on certain leaders in order to attract people to their place of business. They feel that people will not patronize them unless some exceptional bargain is offered to them. From one point of view their reasoning seems perfectly logical. On the other hand, however, it is easy to see that the exceptional bargain offered, which in some cases may actually be selling articles for less than they cost the dealer, is going to plant seeds of suspicion in the minds of the public and that when the purchaser visits the store it is going to require a much higher degree of salesmanship to allay this suspicion than would be the case if no such exceptional bargain had been offered. During these times of reduced labor supply some difficulty may be experienced in securing the quality of salesmanship that is required and the path of safety lies in avoiding price cutting.

A certain man held the view that cut prices are a mistaken business policy. About ten years ago this man started in a line of business where possibly the practice of price cutting is more rampant than in any other line, namely the automobile accessory business. He adopted the practice of selling goods at the list price if the discounts from list did not allow him too great a profit. Where the discounts were great he allowed a reasonable profit. He has always adhered to this practice and to-day is the owner of a chain of several stores and is adding more every year. Each of these stores is competing with both local and city price cutters as well as the mail order houses. Each, however, is a profitable enterprise, though many of the price-cutting competitors have gone ou of business. He has built up a reputation of quality goods and quality service that is of far greater business value than would have been a reputation for price-cutting. To-day when a car owner wants to take a chance he may buy an article or two from some of the price cutters, but when he wants real reliable service he patronizes the store where prices are never cut but where quality and service are always maintained.

It is evident that there can be no fixed rules laid down for price making, it is equally evident that while high prices, that is, prices which are too high, may drive away trade, prices which are too low will result in creating distrust and ill will. The one best price can only be arrived at by careful experiment and study. This price, however, is always sure to yield enough profit to make it well worth while to devote the time and study to the problem that it requires.

The six cent fare has been inaugurated on the Detroit electric railway. The company is experiencing considerable difficulty in collecting the six cents.

Engineering Features Essential to Success of Farm Lighting Business

By Evan J. Edwards*

Various expert conclusions have been given as to the possible magnitude for country home lighting, and these estimates range from three to six million installations. Taking, say, a conservative figure of 4,000,000 installations and assuming an average expediture of $1,000 per installation, the total runs into a figure which before these war times would be quite inconceivable because of its magnitude. Four billion dollar estimates are mentioned quite casually in regard to war-time expenditures, but still stand as being colossal when applied to possible business for a new branch of the electrical industry. I will agree that there is a good chance that many calendars will be used up before there are 4,000,000 installations in this country, but the less optimistic ones may cut the figure to one-half or one-fourth if they wish and the total will yet be impressive. It surely is not unreasonable to compare the possibility of this field with that of the automobile as used by the farmer. Statistics show that there are between two and three million automobiles in the hands of farmers at the present time and some of them are their second and third purchases.

The selling of one country home lighting installation means more in business than the initial $1,000 expenditure. Additional equipment and supplies will be needed as time goes on. Lamp and battery renewals will be a factor.

It is likely that this business will not be handled exclusively by any existing type of dealer. If the present dealer in electrical supplies is to handle it, he may have to learn much about selling things to the farmer. In other words, his biggest job is to learn the farmer, but he must also inform himself as to the engineering relating to these plants, particularly as regards the points of difference compared with 110-volt installations with which he is already familiar. If some other class of dealer already accustomed to selling to the farmer is to take up the business, he must learn everything regarding the electrical side of the business, which is no small job either. Opinions vary as to which of these present dealers has the advantage.

Coming then to the main object of this paper—there are certain important engineering points which are essential to the success of the business and which should be kept in mind by the dealer, whoever he may turn out to be.

First of all, there must be proper recognition of the field for these plants. They are in no case competitive with good central station service. Arguments to the contrary cannot be substantiated by complete facts. They are not adapted to heavy power work. Some of the standard plants are advertised as being light and power plants, but they should be looked upon as essentially for lighting. Heavy power work of the farm cannot be handled economically by the use of motors operating from an isolated generating plant. A standardized plant as now put on the market is of the correct capacity to operate effectively and efficiently the lighting of the average farm premises and can very well handle certain small power work, such as pumping water, separating cream and running the washing machine, but should not be considered for the feed grinder, ensilage cutter and the threshing machine. Hop and Brown acted wisely in informing their enthusiastic prospect that the heavy motor loads were out of the question.

One of the most important engineering questions is that of standardization. Experience in other lines has shown that commercial progress can be measured by progress in standardization of equipment and methods. Satisfactory progress has been made to date in the standardization of country home lighting plants. It is seldom now that anyone mentions a battery equipment other than 16 cells of lead-acid or 24 cells of nickel-iron-alkaline. There are plenty of arguments which could be advanced in favor of both a higher or lower voltage, but 30 volts (nominal value for present standard) is a good compromise and it is to the best interests of everybody concerned that the present voltage standards be strictly adhered to. The lamp and appliance manufacturers have designed their product to best meet the operating conditions as obtained with the above battery equipment. The lamp manufacturers label their product 28-32 volts, meaning that the lamps are designed for these plants which by their nature vary in voltage between these limits in the properly installed standard outfit and wiring.

Some other points of standardization are not so well taken care of.. There is much mechanical standardization which could be accomplished along the lines done by the Society of Automotive Engineers in connection with automobiles. The meter equipment on the switchboards and the method of control of the circuits show considerable variation. There are also certain features of battery design, and particularly methods of battery rating, which could be standardized to advantage. The important point at this time is to appreciate the value of standardization and to bear in mind that the manufacturer who departs from present standards without very well substantiating his reason for doing so, is retarding the progress of the business as a whole. The manufacturer is primarily responsible for standardization of the plant, but a proper appreciation of the value of standardization on the part of the dealer will greatly assist.

It will be up to the dealer who sells the plant to see to it that proper installation is made. A good foundation for the generating unit should be provided; a heavy concrete base is usually advisable. Thought should be given to the location of the generating unit and batteries. It is, of course, advisable to locate the plant near to the heaviest and most important load, which is the house-lighting. The basement of the house is often chosen for this reason and it has the added advantage of more uniform temperature than an outbuilding would have. The batteries are not exposed to the high evaporation rate of the outside summer weather nor to the danger of freezing in winter. It is important to shelve the batteries in such a way that they are substantially supported and easy to get at for inspection and filling. They should be well lighted, so that the owner will readily discover any need of attention to the cells.

The Question of Wiring.

For the man who is accustomed to installing 110-volt systems, perhaps the greatest pitfall in this new business is that of the wiring. He should appreciate that a mere table of current carrying capacity as put out by the underwriters is not adequate. Thirty volt plants have four times the amperage as a necessary consequence of having only one-fourth the voltage, and furthermore, the 1-volt drop, which is 1 per cent in a 110 volt installation becomes a 4 per cent drop in 30-volt installations, and it is the percentage drop which counts in the operation of incandescent lamps and other appliances. If I may refer again to the story of Hop and

* Before the recent N. E. C. A. Convention.

Hereto, you may recall the wiring chart which has been designed to furnish a ready means for obtaining wire sizes which will hold the voltage losses within proper limits. The use of this chart also avoids the guessing which might result in the use of larger wire than necessary in certain parts of the installation. No. 14 is suitable for considerable of the wiring, the same as in a 110 volt installation. In places where larger wire is needed, however, it is needed badly, and the final success of the installation will depend to a considerable extent on having the wiring right.

It is a mistake to assume that the farmer will be satisfied with drop cords and key sockets, even though at first he may think that he is going to be. It is better in almost every case to sell him a wiring installation for his house which is fully up to the standards of the city. Wall switches and baseboard outlets with the handy features of control will be appreciated by the farmer. The farmer is a man of pride and in no sense a piker when it comes to spending money for things that he wants and are worth what they cost. He will have lasting satisfaction only in an installation up to the standards of his city brother. Furthermore, if he does not have convenient switching and flexibility as to outlets he is only half cashing in upon the benefits which are inherent in electrical lighting.

Fixtures and glassware are important. The fixtures can be simple and yet correct in their design. The farmer in his experience with coal oil lamps may not have discovered the devil glare. He may even be inclined to judge the value of a light source by its intrinsic brightness rather than by the resulting illumination of the objects which he desires to see. Nevertheless, in the long run, he will be better satisfied if objectionoble glare has been entirely done away with. Here is the reason for the importance of supplying good reflectors. There may be places in the outbuildings of the farm where bare lamps are not particularly obectionable, but certainly in the house every lamp should be provided with a reflector which protects the eyes from the glare of the filament and at the same time increases illuminating efficiency by directing the light to the lower angles where it is needed.

There are other important points and many elaborations of the few points mentioned here which deserve the thought and attention of those directly interested in pushing the business, but it is sufficient here perhaps to give as I have a very brief treatment of a big subject. I have attempted only to call attention to the possiblities of this new field in the electrical business, and to mention the several things which seem to me to be of greatest importance in attempting to minimize the mistakes that always retard a new development.

Electrical Merchandising a Normal Extension of the Contractor's Field

By M. H. Johnson*

A retail electrical store is a logical step for contractors and dealers toward improving their own situation and general conditions governing the distribution of electrical merchandise. All contractor-dealers, with the exception of a very few who are specializing in their work, are now obliged to have a place of business and a stock of merchandise that are quite suitable to be used as retail stores and this step may be regarded as a normal extension. The character of the business is really simpler than that ordinarily carried on by electrical contractors.

Necessary Primary Steps in Opening a Retail Store.

Those starting to conduct a store will usually find it necessary to clean up their place of business, provide a cash register, counter and display shelves and perhaps add to their stock a small assortment of household appliances. Further than this, a few cardinal principles strictly adhered to and the exercise of common sense is almost certain to result in the development of a paying business not only in the sales made directly from the store, but in the natural development of the construction business by the store and hence the store business from construction work.

The prime requirement for a successful store is to have it attractive, especially so to women. This involves cleanliness, neatness and an interesting display of merchandise. All merchandise shown in the store should be plainly morked with the maker's name and catalogue number, and the selling price, which should be strictly adhered to. Every device displayed for sale should be in such shape that it can be demonstrated upon request. Furthermore, someone capable of understanding and showing the use of the device on sale should always be in the store. With a little training this can usually be done very satisfactorily by the young lady, who is almost universally present in such establishments in the capacity of bookkeeper and stenographer.

An attractive store and courteous treatment are the first essentials and almost certain to bring success. Generally speaking, the sale of electrical merchandise affords all the business a contractor-dealer can handle to advantage and many disasters have resulted from stocking the store with toys, automobile appliances and catch-penny devices.

Inducing the Public to Visit Your Store.

The best method of bringing trade to the store depends partly on the community where it is located and partly on the amount and character of the business normally handled by the individual concern.

In the very large cities the best advertising is done by the window displays and outside signs. In second-class cities newspaper advertising is valuable. In smaller communities moving picture advertising produces good results.

In all cases the word of mouth by the contractor's wiremen and solicitors among customers for construction business is one of the most potent factors.

The sale of domestic machinery, washers, ironers, vacuum cleaners, ice machines, dish washers and ranges is only successful where given special attention by personal solicitation, a careful system of following up prospects and more or less extended terms of credit. Trade of this kind with persons of poor or doubtful credit is generally unprofitable because of the cost of collections.

The sale of seasonable merchandise, covering fans, toys, Christmas tree lighting outfits, to some extent vacuum cleaners and flat irons, will pay when given intelligent attention. To do so requiries great care as to the quantities purchased having the right goods on hand at the right time and judicious advertising, to coincide with the natural demand.

The giving of credit on store sales is important, as some of the best customers prefer it, and besides it helps to give the buyer confidence in appliances they have not been ac-

* Before the recent N. E. C. A. Convention.

customed to. The extension of credit calls for careful oversight and the best information can usually be had from the local Board of Trade or Chamber of Commerce.

Render a Service.

All the foregoing is rather primitive to those who have been in this line, but it is perfectly safe to say that no electrical merchant at the present time is overdoing the above suggestions. For those who have gone some distance in developing this end of the business, the much abused word "service" will bear unlimited consideration and always return profits, financial and otherwise. The only means of replacing the drudgery of this business with the satisfaction of results accomplished is to play the game on the level. It is often called "the game" thoughtlessly. However, the slang expression is underlaid by a world of truth. Ability to convince your friends and customers (they should always be synonymous) that you can supply their electrical needs to better advantage than anyone else is an especially pleasing achievement and the stake it always brings in is profitable business.

The customer to whom you have sold the device he needs and which gives genuinely satisfactory service will remember this fact long after he has forgotten that he paid you more than the other fellow asked and will invariably come back for more when he needs it.

There is, furthermore, at this time an obligation resting on all of us to put our affairs in order and develop our business along lines which will pass the maximum of electrical appliances in service at the minimum of expense.

It is essential of every electrical device that it has a useful purpose; that it will produce the result wanted quicker, cheaper or better than can otherwise be done. It follows that every electrical device put to the service for which it is intended effects a conservation in some form and conservation is now the universal watchword of the country.

Devices for better lighting permit of more work and better work being done. The electrical heating devices must produce results at a saving or they are not successful. The many labor saving appliances do, of course, conserve energy, which may be used for other purposes. Our business is the one relied on to advance civilization. Its development coincides with the development of civilization.

It is, therefore, up to us, the connnecting link between the producer and the ultimate user of things electrical, to neglect no opportunity for the better service of the country along this line, as we cannot make the supreme offering which so many of our friends have done.

In the Campaign for More Convenience Outlets

What the Wiring Contractor Should Do

1.—Visit the new-business manager of your local central station and arrange to secure through him a list of prospects for outlets and wiring, in the home, the office and factory.

A—Classify your prospects according to districts and character (home, office, factory).

B—List each classification separately; be sure to include the address, and, where one is used, the phone number.

C—Work out your plans for securing business from each such prospect.

D—Notify the Society at once regarding the number of special letters and folders that you will mail out to these prospects.

2.—Decide what outlets and receptacles you will sell and install. Be sure that you can explain the construction, purpose and special features of each.

3.—Work out several typical examples of estimates for installing outlets and wiring. That will enable you to supply prospects with a concrete basis for understanding just what they can expect for their money.

4.—Select such of the advertising and selling helps pictured and described in this issue that you can and will make use of. Order them from the Society at once—NOW!

5.—Decide what advertising you will have inserted in your local paper. Supply the newspaper with the copy and cuts, and make arrangements for schedule of insertions, etc.

6.—Hold meetings with those who will solicit orders for outlets and wiring for you; discuss the best methods to pursue; see to it that each man understands what he is to do.

7.—Confer with your local campaign committee; explain what preparations you have made; ask them what further they have to suggest and what they will do to help you.

8.—Communicate with the Society, explaining the steps you have taken and requesting further suggestions.

J. Everard Myers, 4 Gould St., Toronto, has been awarded the contract for re-wiring the factory and installing a quantity of electrical equipment, for the Gendron Mfg. Co. Ltd., 137 Duchess St., Toronto.

What the Contractor-Dealer Should Do

NOTE—You, being a contractor as well as a dealer, will, of course, profit first by the suggestion given for the wiring contractor. In addition:

1.—Decide what time, labor, money-saving electrical appliances you will feature and push during the campaign.

A—Draw upon the manufacturers of those appliances for descriptive literature and special selling helps and information about their respective products. They should be glad to assist you.

B—Invite them to have their travelling representatives call when in your neighborhood and supply first-hand information regarding the strong selling points of their products.

2.—Train those who will meet the trade and sell appliances, so that they will be in a position to advance real sales-producing arguments, facts and figures calculated to convince all prospects and induce them to buy.

3.—Arrange your mailing list of all good prospective purchasers of appliances.

Notify the Society how many mailing pieces you will need for your direct-by-mail campaign to these prospects. Select the mailing pieces from the Sales Service.

4.—Estimate how many price tags you will require and order them from the Society at once.

In case the information which should be written on the tags is not readily available, put someone to work at once digging it out.

5.—Confer at once with whoever arranges your window and store displays, instructing that person to (1) read this copy of the Sales Service through carefully; (2) plan out and make all arrangements for installing window, store and counter displays that will surpass all previous efforts.

In making displays, remember the power of suggestion: The sale of an appliance suggests the purchase of an outlet, and vice versa. Arrange for making your displays accordingly.

6.—If in doubt, don't guess, don't fuss, fume or worry—put it up to your local committee and to the Society.

Connectors for Current Transformers

The two purposes for which current transformers are used are—to reduce the current in the circuit to a value adapted for use with instruments, and to insulate the instruments from the high tension circuit. The design of the transformers is such, that the secondary current is a definite proportion of that of the primary current for practically any value of primary current which may flow. A single-phase circuit having a current transformer is illustrated in Fig. 1, where L represents the load of the circuit, and I the current flowing in the direction shown by arrows at a particular instant. The meter M connected in the secondary of the current transformer has a scale marked to indicate the current flowing at A, thereby taking account of the ratio of transformation in the current transformer. The meter M

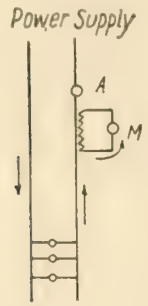

Fig 1.

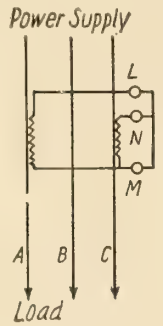

Fig 2.

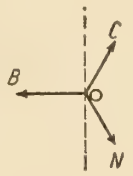

Fig 3.

Fig 4.

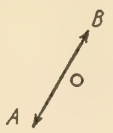

Fig 5.

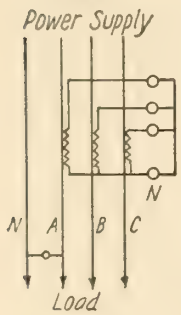

Fig 6.

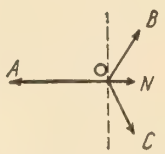

Fig 7.

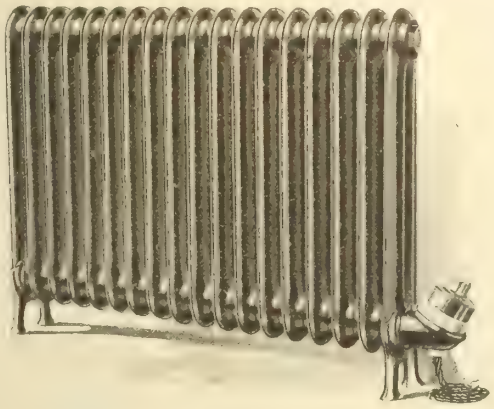
therefore reads exactly the same current a direct reading meter would if connected in the line at point A. The connection of current transformers on polyphase circuits are in some cases rather complicated and we will consider the more common connections in detail.

The most common connection for three-phase three-wire circuit is the reversed V connection shown in Fig. 2, in which two current transformers may be used to indicate the current in all three wires. The current from the transformer in phase A flows through the instruments L and M and so far as the instrument L is concerned is essentially a single-phase connection and instrument L will indicate the current in the Line A. Similarly, the current from transformer C flows through the instruments N and M and the instrument N indicates the current in the line C. The combination of the above currents flowing through the meter M will also indicate the current in line B. This fact is illustrated by the vector diagram in Fig. 3. In considering this diagram let us assume that when the arrow points to the right, that the current is flowing in a particular direction which we will call "positive" and when the arrow is pointing to the left it is flowing in the opposite direction or "negative". When the arrow points up or down the current will therefore be zero and the value of current in any line will be proportional to the distance from the vertical line drawn through O to the point of the arrow.

The current in the lines A and C are represented in Fig. 3 as both positive and each to be one-half their medium value. The current in line B is represented as being negative and at its full maximum value. Now the law of electric currents, known as Kirchhoff's law, is that at a junction of conductors, such as at O, the sum of the positive and negative currents is zero; that is that any current flowing into this point on one or more conductors is equal to the current flowing out of the same point on one or more other conductors. The current in B being negative flows toward the point O and is therfore equal to currents A and B flowing away from this point. Therefore, the current in line B is the vector sum of the current in the lines A and C. Now, since the currents in the instruments L and N are exactly proportional to the currents in the lines A and C, then the current in M must be proportional to the current in B. In Fig. 4 the current in C is illustrated as being zero and at that instant the currents in B and A are equal. The current in instrument N is therefore zero and since the current from A flows through the meters L and M, their readings are necessarily equal, which, as can be seen from the diagram, is necessarily the case.



This connection for instruments may be used for ammeters, relays, trip coils or the current coils of wattmeters or power factor meters, and in fact any current carrying coil whatsoever. However, there are some objections to using this connection for protective relays and trip coils which will be considered later in a discussion of the "Z" connection.

In the above we have considered that the three-phase load was perfectly balanced. The indication of the meters, however, will be correct as well for any unbalanced condition. The worst unbalancing possible is to have a single-phase load on two wires with no load on the third. Suppose a single-phase load is connected across wires A and B—The current will then bear the relation as shown in Fig. 5, that is if current in A is positive, the current in B will be negative and of the same value. The current from transformer A will flow through the instruments L and M indicating an equal load on wires A and B and no current will flow in N, indicating no current in C. Suppose again that a single-phase load is connected to lines A and C—The current from line A will flow through instruments L and M as before and current from Line C will flow through instruments M and L. These currents flow through instrument M in opposite direction and being equal are canceled. Instrument M therefore indicates zero current in line B, which is correct.

In case of a three-phase four-wire system, it is necessary to use three transformers which are usually connected in Y or star as shown in Fig. 6. Since it is possible for some load to be connected between one phase and neutral, such as between A and N as shown, the current on the other phases is thereby unbalanced so that it is necessary to use three transformers. With the connections as shown, each instrument being connected to a transformer in each phase, the operation is essentially the same as for single- phase. In Fig. 7 the current which flows into the junction of conductors does not necessarily flow out at B and C but a position may be carried off on the line N. The instrument at N will indicate the value of current flowing in the neutral wire N.

The Salisbury Heater.

The Salisbury Electric Co., Ltd., have distributed a little folder describing the Salisbury Electric Radiator. This is a pressed steel radiator, filled with a specially prepared, non-corrosive, non-inflammable liquid, in which the heating element is immersed. The heater is made in various types, ranging in capacity from .6 to 2 kw. The smaller size is arranged for single heat only, but other sizes are provided with 3-heat switches and connections. This company are also now marketing an electric water heater, as well as the standard household appliances.

Hubbell Specialties Now Made in Canada

Announcement is made elsewhere in this issue that the Harvey Hubbell Company of Canada have established in Toronto a completely equipped factory for the manufacture of Hubbell electrical specialties. The new factory has been operating for some time as a matter of fact and has been accumulating stock in anticipation of the demand which will follow the present announcement.

The Toronto factory, which is situated on Labatt Ave., will turn out pull, key and keyless sockets, attachment plugs and receptacles, shade holders, lamp guards, reflectors, etc., in effect, the complete line of specialties so well known to the Canadian trade.

No better guarantee could be given of the service organization of the new company than the fact that it will be under the management of Mr. E. G. Mack, the efficient managing director of the Crouse-Hinds Co. By locating the Hubbell factory in close proximity to that of Crouse-Hinds Co., Mr. Mack will be able to co-ordinate the two organizations and no doubt will win for the new company as enviable a reputation as the Crouse-Hinds, under his guidance, has long held.

We understand that everything is in readiness for immediate shipment of any and all Hubbell equipment orders.

The Lancashire D. & M. Co. in Larger Quarters.

The Lancashire Dynamo and Motor Co., announce that after September 1st, 1918, they will be located in new and larger premises at the corner of Niagara and Bathurst Streets, Toronto, where they will be equipped to handle machinery efficiently up to ten tons, and where the facilities for repairing and rewinding will be much improved. The company will be in a position to give all customers prompt and efficient service.

Lieut. Alan Sullivan, formerly secretary of the Canadian Electrical Association, who recently joined the staff of the Royal Air Force, met with an accident recently, due to engine trouble, which necessitated several days in the hospital.

Trade Publications.

Sangamo Meters—Bulletin No. 48, issued by the Sangamo Electric Co., Springfield, Ill., describing their Type M.S. ampere-hour meters. The principles of this mercury-motor meter are described and illustrated in great detail, as well as its many commercial applications.

C.G.E. Publications—Bulletin No. 43411, illustrating and describing the lighting of windows and show cases with Edison Mazda lamps. Also Catalogue No. 257, describing and illustrating "Regent" globes and reflectors for commercial and ornamental illumination.

Disc Insulators—Catalogue No. 2, by the Jeffery-Dewitt Insulator Co., Huntington, W. Va., describing their high-tension disc insulators. The illustrations show in detail the dimensions and construction of the various types. The frontpiece shows the effect of 600,000 volts, 100,000 cycles, on 5 J.D. discs.

Telephone Economy—A folder issued by the Bell Telephone Co. of Canada, being a reproduction of a series of newspaper advertisements designed to point out to their telephone customers the possibilities in the way of co-operation between the company and the customer with a view to making their service more perfect and operating it more economically.

Condulet Suggest 55,—by the Crouse-Hinds Co. of Canada, illustrating an actual installation in one of the larger cotton mills of the United States, of YC condulets. Other types of the Y series, included in the same installation, are also shown. The Crouse-Hinds Co. have also issued a supplement to Bulletin 303, known as 303 A, describing Imperial flood lighting projectors, type SDXN designed for river and harbor service.

The Steel City Electric Co., of Pittsburg, have issued Catalogue No. 33. This is the first edition of the complete catalogue ever distributed by this company and marks the discontinuance of their previous plan of issuing separate bulletins of their various products. Copies of the catalogue may be had on request. A noticeable feature in connection with this catalogue is the index on page 101, which will be found a great convenience to the intending purchaser.

Trutint Units—booklet being destributed by the Canadian General Electric Co., describing the Nela Trutint units for general illumination, which are distributed in Canada by this company. These units are specially valuable for color matching in general retail stores, and are also coming into use in art stores and galleries, industrial and many other plants. Wherever true daylight at any time of the day or night is a valuable asset, these units are of special value.

Illuminating Glassware—Catalogue No. 6, illustrating color decorations, etchings, cuttings and other finishes on the illuminating glassware of the Jefferson Glass Co., is a handsome booklet of 70 pages, thoroughly well illustrated with full page cuts and containing complete information as to dimensions, prices, standard packages, etc. The Jefferson Glass Co. are also distributing a catalogue describing the 2-piece lighting units, "Dominionlite" and "Jeffersonlite," and the Maple Leaf bowl. These are popular 2-piece units noted for their efficiency in office or industrial work.

Westinghouse—Catalogue 1-B., wiring devices and carbon circuit breakers, is now being distributed by the Westinghouse Electric & Mfg. Company; this is a 224-page, 8½ x 11, catalogue listing fuses, knife switches, service switches and boxes, solderless connectors, disconnecting switches, instrument switches, safety switches, safety panel boards, safety floor boxes, and carbon circuit-breakers, part of which have previously been listed in the old sectional 3001 catalogue. The Westinghouse Company have also issued a revised edition of Catalogue 3-B in which are included for the first time the types AW and FW duplex instruments.

Current News and Notes

Beauce, Que.

La Manufacture de Boites de St. Evariste, Limited, has been formed to deal in electricity in the district of Beauce, Que. The capital is given as $20,000.

Fort William, Ont.

The Fort William end of the electric street railway system carried 2,672,144 fare passengers during the year ended June 30. The car mileage for the year reached the total of 629,688 miles. The gross earnings from operation amounted to $117,452; the net income or loss was $32,914. Operating expenses reached the sum of $94,177. The taxes, funded debt, etc., totaled $56,190. The total main track mileage of that end of the system is 19.88. The Port Arthur system carried 2,624,461 passengers, the mileage totaled 650,885. The net income or loss was $46,474; gross earnings from operation, $11,609; the operating expenses totaled $91,986; the taxes, funded debt, etc., reached $69,097, and the total main track mileage in use is 12.43.

Lake St. John, Que.

With a capital stock of $99,900, les Minoteries Electrique de Metabetchouan, Limited, has been formed to exploit and deal in electric power in all the parishes of the county of Lake

Montreal, Que.

A general increase in wages to all telephone employees is announced by the Bell Telephone Company, to become effective on the first of September. The increases vary from 25 per cent. in the case of lower salaried employees to 10 per cent. for those receiving higher wages. It is stated the increases will amount to approximately $1,300,000 a year, $825,000 of which will go to the operators.

Electrics Limited has been incorporated as a joint stock company. Head Office Montreal; capital $50,000.

Mr. R. A. Ross, of Montreal, has been appointed chairman of the Commission on Lignite, appointed by the Dominion Government. Mr. J. M. Leamy, provincial electrician, Winnipeg, and Hon. J. A. Sheppard, former speaker of the Saskatchewan Legislature, are the other members.

Niagara Falls, Ont.

The National Abrasive Company, of Hamilton, have decided to move to Niagara Falls and not to Renfrew, as formerly reported. The power shortage in Hamilton is responsible for the move and considerable indignation is evident because of the statement that the Ontario Hydro-electric Commission could grant a power allotment of 5,000 h.p. at Niagara Falls and not at Hamilton, where the factory was already established.

North Vancouver, B.C.

In a resolution passed unanimously by the city council of North Vancouver it was decided to ask the Union of B.C. Municipalities, at their convention in Penticton in September, to endorse a petition to the provincial government for the establishment of a hydro-electric commissioin for the development and control of British Columbia water powers. This commission would take pattern from the activities of the Ontario Hydro-electric Commission.

Port Arthur, Ont.

Claiming that the gross earnings of the company have not been as large as expected this year, through limited operations of the elevators at the head of the lakes, the Kaministiquia Power company submits its report for the month of June. Despite all this, the report is able to show increased net as well as gross earnings, although the expenses rose slightly more than the earnings. The gross earnings were $34,778 as compared with $33,015, an increase of $1,763; after allowing for operating expenses, maintenance and fixed charges, the surplus was $20,993 as compared with $19,708 for June, 1917. For the eight month ending June 30, the gross earnings were $277,644, as compared with $251,991, a gain of $25,653; for the same period the surplus was $165,351, as compared with $151,625, an increase of $13,,726.

Point-aux Trembles, Que.

A new lighting system has been installed at Point-aux-Trembles, Que., consisting of 196 lamps, each 250 c.p.

Regina, Sask.

The city council of Regina have decided against any increase in fares on the electric railway. Methods of making this mode of travel more popular with the public have, however, been suggested and the city will also secure estimates on the cost of equipping the rear vestibules with outer doors for use during the winter months. Automatic trolley catchers will also have to be installed in this event.

Rosthern, Sask.

Another Venn Severin engine, an exact duplicate of the one now in use, has been ordered for the Rosthern power house. The extension is made necessary by large increases in the demand for power. New street lights have also been installed in Rosthern.

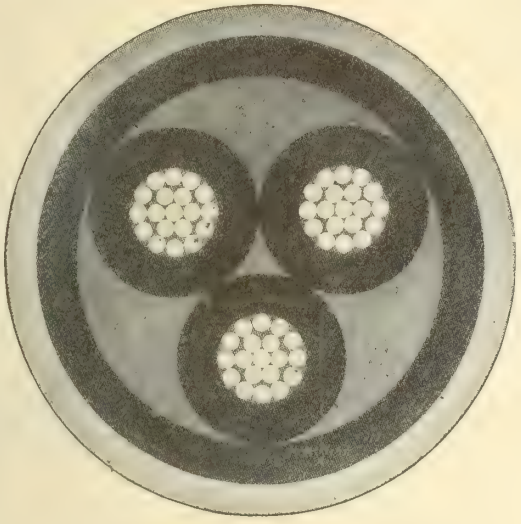
St. Thomas, Ont.

The hydro-electric commissioners of St. Thomas, Ont., have applied to the provincial commission for an extra allotment of 400 horse-power to supply the demand of industries in that city.

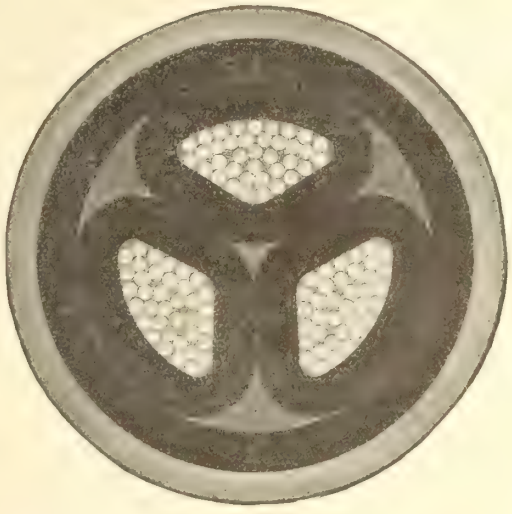
Unionville, Ont.

On September 16 the ratepayers of Unionville, Ont., will vote on the question of extending the hydro transmission line from Agincourt to their municipality. The by-law, if passed, will provide for an expenditure of $10,000, which will be borrowed for the purpose.

Vancouver, B.C.



It has been announced that the B. C. government will appoint a Public Utilities Commission to handle such situations as that existing between the B. C. E. R. Company and the city of Vancouver regarding an increase in fares. The Commission will be invested with wide powers, not only over public utilities but also over municipalities. It will have authority similar to the Dominion Railway Board to hear and investigate complaints, make orders as to service and inprovements, fix the rates to be paid and make investigations into the affairs of companies for the purpose of ascertaining the financial returns necessary for successful operation.



Winnipeg, Man.

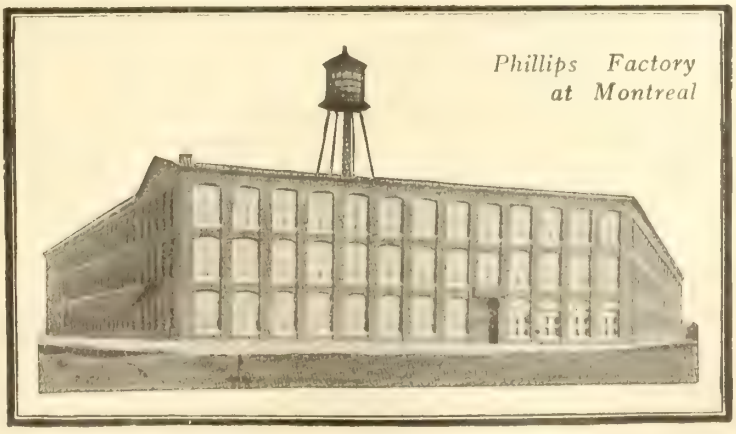
The monthly report of the Winnipeg hydro-electric system for June, shows that the revenue for the month was $82,639.91 and the expenditure $89,230.03, showing a deficit of $6,590.12. The total for the first six months of the year, however, shows a surplus of $30,925 19.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Electric Generator For Sale

A 275 K.W. compound wound Railway Generator, manufactured by Bruce Peebles, England. Just received, and has never been used. At normal speed 550 volts at no load, 600 volts at full load. Twin machine to one that has been used by the advertiser, and has given absolute satisfaction for several years. Full specification furnished on request. Was contracted for before the war and price should be very attractive. Address, Moose Jaw Electric Railway Co., Ltd., Booth Building, Ottawa, Ontario. 17-17

Relation of the Electric Vehicle to the Transportation Problem

"Undoubtedly the electric vehicle promises to play a large part in the solution also of our stupendous terminal problems. Formerly our terminal problems were considered as local problems, whereas today they are national problems of the greatest importance. The port of New York cannot liberate itself with sufficient rapidity from existing conditions. We have the streets filled with horse trucks, and inefficient methods of getting materials away from the terminals. There is a clinker on the grates of the transportation problem, and we must devise means of getting rid of that so as to keep a lively draft and keep up the circulation. In my judgment, looking at it in its broadest aspect, I believe that the key to the solution of this and the clearing up of the terminal condition, lies in the electric vehicle."—Past President Lieb, of the N.E.L.A.

FOR SALE

Immediate Delivery

4—300 H.P., 200 lb. pressure water tube "Atlas" Canada Foundry boilers.
4—201 H.P., 160 lb. Babcock & Wilcox water tube boilers.
1—Feed water treating tank.
5—Boiler feed pumps.
1—Wainwright feed water heater.
3—Jet Condensers.
1—1,000 H.P., 98 R.P.M., 24 inch x 36 inch x 46 inch Inglis Vertical Cross Compound Condensing Engine.
1—Canada Foundry Triplex Pump, motor driven, 300 gallons per minute; cylinders 8 inch x 12 inch.
1—Traveling Crane, 35 foot span.
2—150 K.W., 250 volt, D.C. Generators, direct connected to Peerless self-oiling automatic engines, 125 lbs. working pressure, 230 R.P.M.
2—400 K.W., 250 volt, 300 R.P.M., belted Compound D.C. Generators, C.G.E.
4—200 K.W., 360 R.P.M., single phase, 60 cycle, 2200 volt, C.G.E. A.C. Generators.
Quantity of 52 inch belting, idlers, and various boiler and engine room accessories.
Piping, Valves, Fittings, etc.
180—Type H, C.G.E. 2200/220/110, 60 cycle line transformers, sizes 1 K.W. to 15 K.W.
2000—Poles in various lengths, 60 ft. to 20 ft. Crossarms, brackets, insulators, etc.
Quantity of No. 6 weatherproof wire.
1500—Watthour meters, 110/220 volt, 60 cycle, and 250 volt D.C. Ferranti and C.G.E. Various sizes from 5 amp. to 150 amp
10—D.C. motors, 500 volt, 1 H.P. to 20 H.P.

Miscellaneous lot of general equipment used in connection with the generation, distribution and sale of electric power.

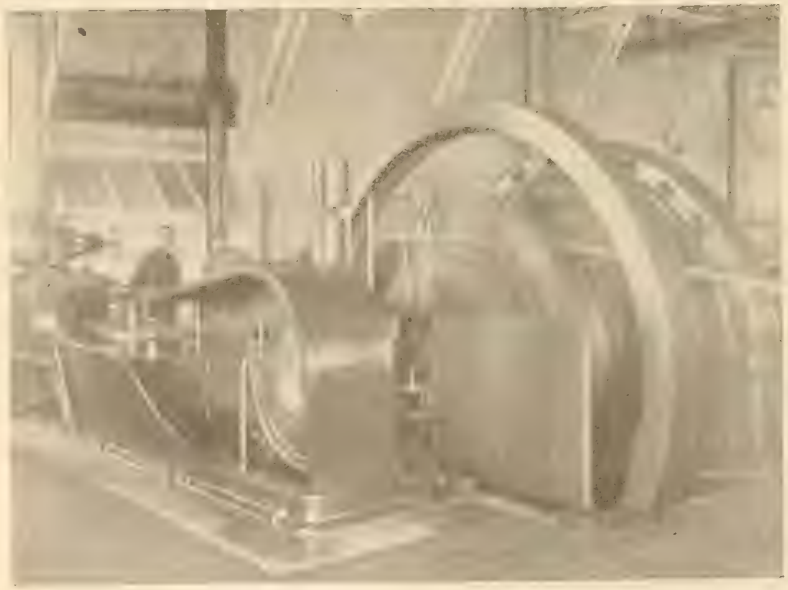
If a Brush Absolutely Refuses To Spark!

is that not a very good reason for fitting it on your motor generators and commutators?



No-Spark Carbon Brushes

wear longer because they are frictionless and self-lubricating. The remarkable economy of these brushes will appeal to you. They have often outlasted the ordinary brushes 8 to 12 times over.

Write for our latest bulletin.

Manufacturers of High and Low Tension Porcelain Insulators

Hydro Electric Equipment For Sale

3—350 KVA., 2300 volt, 3 phase, 60 cycle, 360 r.p.m., rotating field Vertical A.C. generators with two guide bearings but no thrust bearings, 40-degree continuous operation, 25 per cent overload for 24 hours, 50 degree rise.

3—15 K.W., 125 volt, 360 r.p.m., 4 poles, No. 10 SV frame, type "S" D.C. generators, vertical type, for excitation of above A.C. machines.

1—Four-panel switchboard with Tirrill regulator for control of above three A.C. generators and one feeder circuit. All of the above electrical machinery is of Westinghouse manufacture.

3—Trump pattern water turbines, vertical type, of 454 H.P., each under not less than 50 feet head, at that head using 6,000 cubic feet of water per minute, with an efficiency of 80 per cent. Also 3 cast iron heads with trash racks, 3 sections of 50 in.—¼ in. steel pipe between turbines and gate valve, 3 sections 50 in.—¼ in. steel pipe between trash rack and gate valve. 3—draft tubes 5 ft. long and 45 in. diameter.

3—Woodward Compensating governors for water turbines.

3—50 in. gate valves with bronze screw, nut, bronze seat and bronze face on valve where it comes in contact with seat, equipped with by-pass valve.

These turbine wheels and connections manufactured by the Pratt Iron Works, Akron, Ohio :: ::

Engine Generator Sets

ALTERNATING CURRENT

1—450 KW., G.E., 2300 volt, 3 phase, 60 cycle, 100 R.P.M., direct connected to Allis cross compound Engine, complete with Wheeler condenser and feed water heaters.

1—600 KW., West. Alternator, 2300 volt, 3 phase, 60 cycle, direct connected to West. cross compound Engine.

1—700 KW. Ditto, direct connected to gas Engine.

1—Alternator, C.G.E., 60 cycle, type T.T.B., class 48-600-1501, Form E., volt 2,200, amp. 158, speed 150, direct connected to a Rice & Sargent Providence Engineering Works 18 in. x 36 in. x 32 in., horizontal cross compound condensing engine, complete with condensers; Wainwright horizontal copper tube water-heater; switchboard, piping and valves. Ask for further information.

DIRECT CURRENT

1—550 KW., 600 volt, A.C.B. Generator, direct connected to a Goldie & McCulloch cross compound Corliss Engine, complete.

MOTOR GENERATOR SETS

1—300 KW., G.E., 125/250 volt, 720 R.P.M., D.C. Generator, direct connected to one 450 H.P., 3 phase, 4000/2300 volt, 60 cycle, Ind. motor, complete with switchboard equipment.

1—150 G.E., 125/250 volt, 900 R.P.M., D.C. Generator, direct connected to suitable syn. motor, 2300 volt, 3 phase, 60 cycle, complete with switchboard equipment.

2—30 KW., 125 volt, West., 1140 R.P.M., D.C. Generator, direct connected to one 3 phase, 60 cycle, 220/440 Ind. motor.

ROTARY CONVERTERS

2—200 KW., 3 phase, 25 cycle, 600 volt, D.C., primary, 13200/1180 volt.

1—500 KW., 550 volt, D.C., West., 3 phase, 25 cycle, with 3 suitable S.P. Transformers, 13200 volt P. and 390 volt S.

4—500 KW., 600 volt, D.C., Rotary Converters, 3 phase, 25 cycle, with suitable transformers; 6600/5940 volt P., 430-286-143 volt S.

1—300 KW., 575 volt, D.C., 370 volt, A.C., 600 R.P.M., complete with three 185 K.V.A., 60 cycle transformers, 2200 volt P., 370 volt S.

STEAM TURBINES

2—400 KW., West., 3600 R.P.M., 160 lb. Steam, 2300 volt, 3 phase, 60 cycle, complete.

1—1500 KW., G.E., Curtis, 3 phase, 60 cycle, 2300 volt, 3600 R.P.M. Complete.

1—500 KW., Allis-Chalmers, 2200 volt, 3 phase, 60 cycle, 3600 R.P.M, complete.

1—1000 KW., Allis-Chalmers, 600 volt, 3 phase, 60 cycle, complete with condensers.

HYDRO ELECTRIC UNITS

2—Hydro Electric units, each consisting of one 1200 H.P. double bronze runner, horizontal cylindrical Leffell Turbines, complete with Governors and Draft Tubes. Direct connected to each of these units are two 437 K.V.A., 3 phase, 60 cycle, 4400 volt, 300 R.P.M., G.E. Generators. Equipment is complete with Switchboard, Oil Switches, Instrument Transformers, etc. Equipment practically new.

1—Hydro Electric unit, 1200 H.P., as above, with one 875 K.V.A., G.E. direct connected unit.

PUMPS AND COMPRESSORS

1—1,000 gal. Underwriter Fire Pump.

1—800 ft., 30 lbs., Vertical Air Compressor.

1—600 ft., 30 lbs. Horizontal Air Compressor.

1—200 H.P., Worthington, 2 stage, 12-inch Turbine Pump, rated capacity 4000 G.P.M., at 60 lbs. pressure, direct connected to one 100 H.P., 3 phase, 60 cycle, 440 volt, 575 R.P.M., Westinghouse Induction Motor, complete with auto starter and no-voltage release.

1—1160 ft. Sullivan two stage belt driven air compressor complete.

1—1586 ft. Sullivan two stage belt driven air compressor, complete.

MISCELLANEOUS

2—Light Freight Car Trucks, splendid condition.

1—10-ton, 4 wheel double block steam locomotive, construction crane.

1—50 H.P. Foss Gas Engine, speed 200 R.P.M., one cylinder; flywheel 4 ft. x 12 in. Used only three weeks.

We also handle a full line of Electric Railway Equipment and Supplies

Our stock changes daily and above list is only a small proportion of what we have. For further particulars wire, telephone, or write. Let us solve your problems. All engineering service without obligation. We advertise and sell your released equipment without cost to you.

THORDARSON TRANSFORMERS
FOR EVERY PURPOSE
THORDARSON ELEC. MFG. CO. CHICAGO

Give It the Oil Test

Spaulding HARD FIBRE

Soak a sheet, rod or tube of Spaulding Hard Fibre in oil. Prove for yourself that oil will not penetrate this dense, horn-like material.

Unlike rawhide, leather and hard rubber, Spaulding Hard Fibre is impervious to oil, making it an ideal material for parts which are likely to become covered with oil.

Physical Properties

Its electro rupture is 200-400 volts per 1/1000 in. of thickness; tensile strength 10,000-20,000 lbs. per square inch; compressing point, 38,000-42,000 lbs. per square inch; shearing strength, 9,000-13,000 lbs. per square inch. It can be machined, sawed, stamped, bent, threaded, drilled and finished in many attractive ways.

Made in red, black and grey colors. Send for samples. Our Specialty Department is equipped to machine special parts to your own specification.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Ins. 332 pages, illustrated. Price $2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

Electrical Meters, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price $6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated. Price 65c.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

ESTABLISHED 1849
BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.
THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.
THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

Each time you renew an

ECONOMY renewable FUSE

with a

"Drop-Out" Renewal Link

you will renew your gratification over cutting your annual fuse maintenance costs 80%.

CONSERVE your fuse money. It is unpatriotic, as well as bad buying policy, to use a dollar's worlh of material for what could as well be accomplished with twenty cents' worth.

In all branches of industry—in modern homes, institutions, public buildings— billions of dollars' worth of equipment and property are protected against the fire and accident hazards of overloads and short circuits through the fusing of a million circuits with Economy renewable Fuses and "Drop Out" Renewal Links.

OXY-ACETYLENE WELDING & CUTTING

A Vital Necessity in Every Industry

1500 lb. Gas Engine Cylinder cracked by frost and reclaimed by Oxy-Acetylene Welding

Over 80% of the material that appears to be only fit for scrap can be used over again practically equal to new by welding the parts together by the Oxy-Acetylene Process.

This not only means saving the actual cash value of the material reclaimed, but relieves the situation brought about by the excessive demand for metals of every description.

Moloney Service Transformers

are all supplied with brass plates fastened on the inside of the cover of each transformer; all connections marked plainly. They do not get covered with dirt or stained with oil like a blue print does. You always have them before you when changing taps. Heavy bushings eliminate breakages in shipment and handling

Moloney Transformers are manufactured in a factory that was built especially for that purpose only. They are designed by Engineers and built by men who make a specialty of this work.

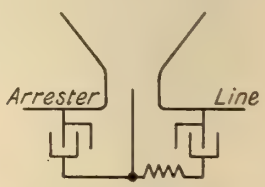
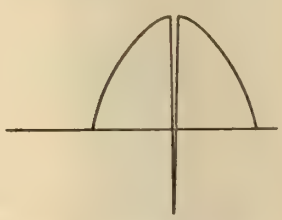
The Impulse Gap

The greatest advance in protection from lightning since the electrolytic arrester was invented.



Impulse Gap as applied to Westinghouse Electrolytic Lightning Arrester.

After exhaustive research, Westinghouse engineers have perfected "The Impulse Gap", as described in the May proceedings of the A.I.E.E.

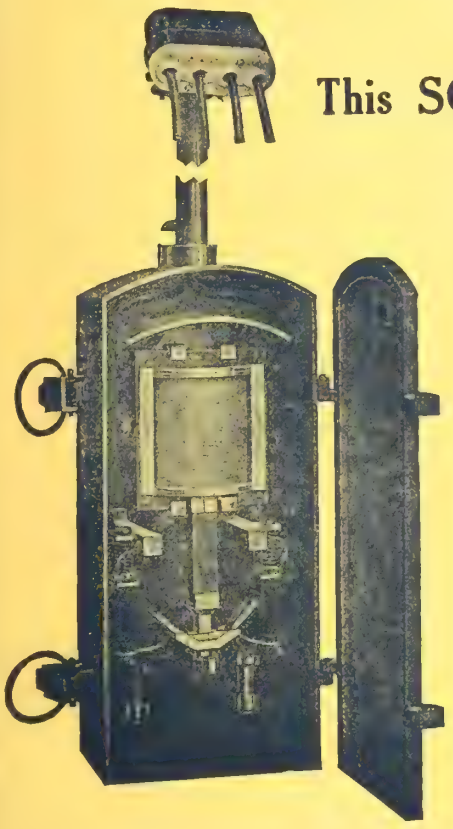


The "Impulse Gap" greatly increases the protection given by an electrolytic arrester, by automatically selecting high frequency surges and discharging them at a lower voltage than the normal setting of the horn gap. The high frequency discharge voltage may be as low as 2/3, or even 1/3, of the normal frequency value. It is thus possible to use a gap setting that will ensure against too frequent discharging, on minor surges of normal frequency, yet which will give any desired degree of protection against really dangerous surges. It is the only device that will protect insulation between turns against a steep wave front surge of reversed potential, i.e., a sudden drop in voltage.

Through the use of standard porcelain insulators as condensers, only a minor mechanical modification of existing designs has been necessary.

The "Impulse Gap" uses a circuit that is balanced as to voltage, at normal frequency, but becomes unbalanced and starts a discharge in the case of any high frequency surge. At normal frequency there is no difference of potential between the mid point of the condensers and the auxiliary electrode midway between the horns. A high frequency, however, passes freely through the condensers and piles up its full voltage across the resistance, that is, across one-half of the total gap, which, therefore, breaks down, causing the entire gap to discharge. The arc then rises on the horns and is dissipated as usual.

Wiring Diagram of Impulse Gap Connections.



Static Impulse Superimposed on Voltage Wave in Opposite Direction.

Westinghouse

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

G&W ELECTRIC SPECIALTIES

Applying Military Methods to Electrical Distribution

The highly organized military machine responds to emergencies, moves to meet the unexpected, with clock-like precision. But without its ability to move readily, without mobility it would be useless in times of stress.

Equally helpless in emergencies or unusual conditions is any system of electrical distribution which is inflexible —which is so locked together that load-shifting or cable change overs cannot be accomplished quickly and economically—which makes cable-cutting and expensive temporary repairs a part of "trouble" handling.

G. & W. Distribution Specialties provide flexibility in the control and operation of distribution circuits. Their disconnecting and switching features are the basis of a flexible, interconnecting and disconnecting system of electrical distribution.

G. & W. engineers have applied the military idea of "mobility" to distribution engineering. They have applied it to hundreds of G. & W. installations on both Central Stations and large Industrial properties. These engineers are at your service to discuss the money-saving possibilities of G. & W. devices for your distribution circuits either overhead or underground. **Write for bulletins.**

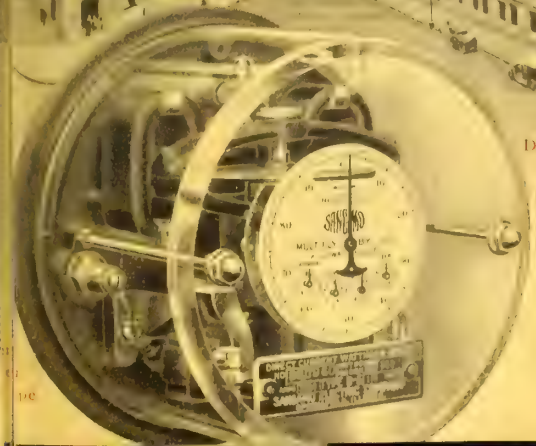
XVII No. 18 Toronto, September 15, 1918

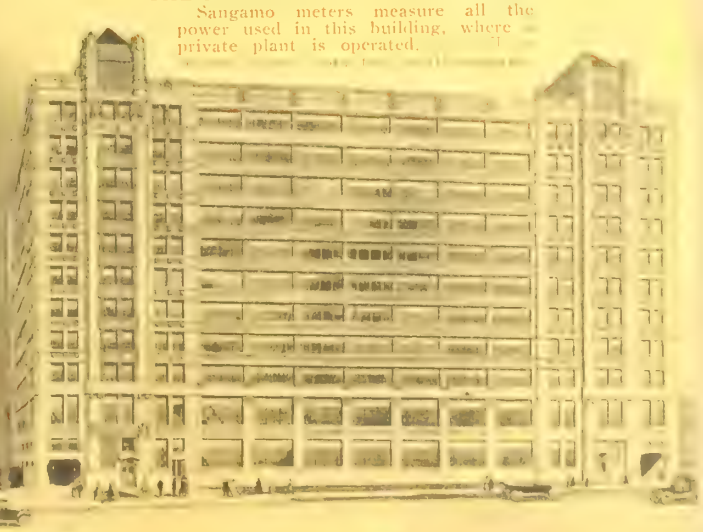
Electrical News

Generation, Transmission and Application of Electricity



THE METHODIST BOOK BUILDING
Eighteen Sangamo meters of varying capacities (100 to 1200 amps.) are used, by the Toronto Hydro-Electric System to measure the power supplied, and by the customer on his switchboard to measure power generated, also in every department to record consumption of each department.

C.P.R. BUILDING
Toronto Headquarters of the C. P. R. Co. Sangamo meters measure all the power generated in the building plant and record distribution on various floors.



DOMINION BANK BUILDING
Head Office of the Dominion Bank of Canada. Sangamo meters measure both the Toronto Electric Light Company's supply and the power generated in the building's own plant.

Canada thinks well of Sangamo

With thousands of central stations, great buildings and mighty industries in the United States Sangamo equipment throughout, and with such installation as the 60,000 ampere meter at Niagara Falls—the largest load ever carried on a single meter—the superiority of Sangamo products is well established. But this appreciation of Sangamo excellence does not stop at the "dividing line," as evidenced by the few Toronto installations shown here—They are representative of the class of Sangamo meter users throughout the Dominion. Canadians require proof of quality in service. Let us offer you some convincing proof.

THE SIMPSON MAIL ORDER BUILDING
Sangamo meters measure all the power used in this building, where private plant is operated.

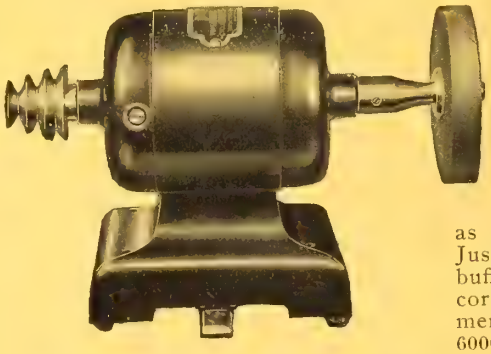
Northern Electric
"DUMORE" UTILITY MOTORS



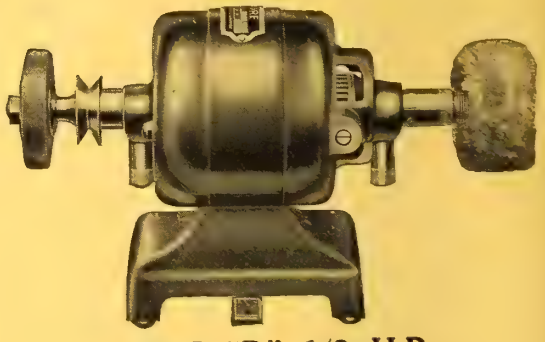
——are a boon to Housewives, and go a long way towards helping solve the servant problem by furnishing sufficient power to do light chores. "DUMORE" Utility Motors are small in size but capable of long, hard service in driving many domestic appliances, or with attachments for polishing silverware, cleaning cutlery, sharpening knives, etc., etc.

TYPE "A" 1 25 H.P.

Built to meet the demand for a light, compact power unit. Finished in black enamel. Equipped with 3 ft. of cord and attachment plug, wheel arbor and emery wheel. Wheel arbor nickel plated. Speed 2000 to 9000 R.P.M.

TYPE "B" 1/25 H.P.

The Type B Motor is the same as the Type A illustrated above, excepting that it is finished in all nickel plate. Equipped with 3 ft. of cord and attachment plug. Makes a very attractive looking motor for any use.



TYPE "C" 1/16 H.P.

Light and powerful. Always ready for use, and is as near trouble proof as it is possible to make a motor. Equipped regularly with 3-step pulley on one end of the motor shaft and a wheel arbor on the other, together with emery wheel. The Type "C" can be equipped the same as the Type "D" motor if so ordered. Just the motor for light polishing and buffing work. Equipped with 8 ft. of cord and attachment plug. Cutler-Hammer 3-speed Rheostat. Speeds 2000-6000-8000 R.P.M.

Practical—Efficient—Economical

For Jewelers, Dentists, Hotels and Restaurants the "DUMORE" Utility Motor will be found indispensable in a great many ways. Furnished in three sizes —"A"—1/25 H.P.; "C"—1/16 H.P., and "D"—⅛ H.P. For the benefit of the trade we have undertaken to advertise these famous "DUMORE" small motors to the public through the Daily Papers from coast to coast, and it will be to your distinct advantage to carry this line in stock for demonstration when called upon to do so.

For full particulars, prices and attractive literature, write our nearest house

TYPE "D" 1/8 H.P.

TThe Type "D" Motor is one of the most popular of stock sizes. Is especially adapted for jewelers' and dentists' work. Equipped with 8 ft. cord and attachment plug. Cutler-Hammer 3-speed Rheostat in the base. Shaft ends are tapered. Ritter chucks and wheel arbors can be used on this motor. Speeds 2000-6000-8000 R.P.M.

O-B PRODUCTS
Quality First

O-B Gas-Weld Bends are particularly suited for paved streets. Only one or two bricks need be removed. The splice-plate is not disturbed—a valuable feature on any kind of rebonding.

O-B Rail Bonds Score Four Big Points

One large electric railway commenced rebonding two years ago and has used for the work a total of 5500 O-B Gas Weld Bonds.

Recently the road reported that due to the O-B Bonds:

It has cut power cost.

It has given better service.

It has reduced the number of burnt-out armatures.

It has kept better schedules.

Good bonding always saves money and improves operation. Any O-B Bond is a good bond.

There are several types—one for each condition. Take up your problems with our bonding specialists.

Absorbs the Shock

Our special C. & H. Poly-Phase Meter is safe because it is fitted with new double terminal blocks that absorb the shock and reduce the danger of accident resulting from overloaded wires and from surge conditions during lightning storms.

This meter also has more inside room for the connections, and the three or four lines are carried straight through the meter from the left to right. In every respect this C. & H. Poly-Phase is a Safety Meter, and is undoubtedly the one to select for Installation on Long Distance Transmission.

C&H Poly-Phase The Safety Meter

The Company's guarantee goes with every instrument. The new Poly-Phase is as near perfect as it is possible for a meter to be.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

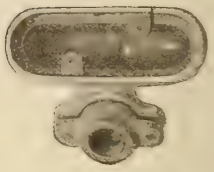
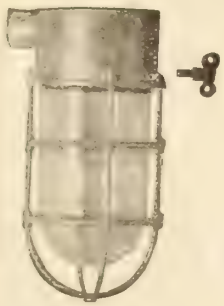
CONDUIT PIPE FITTTINGS



Made in Canada

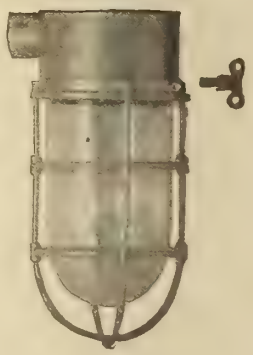
TYPE A



TYPE B

TYPE F

In introducing to the trade C.G.E. Conduit Pipe Fittings, we desire to call particular attention to the following points, in connection with their manufacture:



TYPE V
Vapour, Gas and Dust Proof

All C.G.E. Pipe Fittings are made of pure metal, carefully selected to ensure proper tapping and threading, well-japanned on the inside and electro-galvanized on the outside.

The cover openings are ground thoroughly flat and screw holes well centred.

All covers are fitted to castings before shipment, to avoid possible drilling error or extreme shrinkage of porcelain.

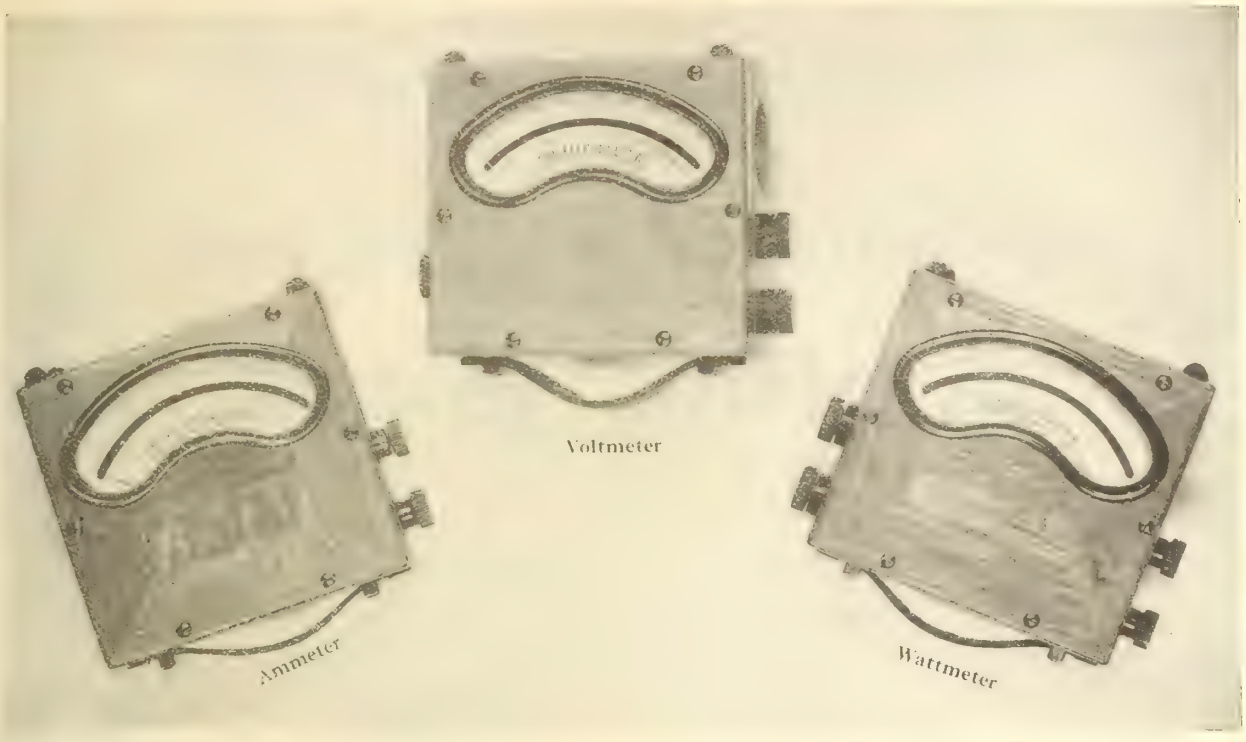
In general quality, high finish and uniformity of product, C.G.E. Fittings compare most favorably with any other make on the market.

TYPE VH
Vapour, Gas and Dust Proof.

Every shipment is warranted to maintain this high standard—samples will gladly be forwarded free of charge, on request.

C.G.E. Fittings comprise all standard types.

C.G.E. Fittings are approved by the National Board of Fire Underwriters and by the Hydro Electric Power Commission of Ontario.



And they Cost Less Money!

Bulletin No. 618, describing these fittings, will be mailed on request to our nearest office.

CANADIAN GENERAL ELECTRIC CO.

LIMITED

Head Office: Toronto. Sales Offices: Montreal, Quebec, Halifax, Sydney, Ottawa, Cobalt, South Porcupine, London, Winnipeg, Calgary, Edmonton, Nelson and Vancouver.

Type P-8 Portable Instruments

This is the smallest and lightest accurate set of portable ammeters, voltmeters, and wattmeters for A. C. and D. C. Service.

It is applicable to all commercial frequencies and wave forms without appreciable error and on direct current the accuracy is very high.

Each instrument weighs under 2 pounds. Dimensions are only $4\frac{3}{4}$ in. by $4\frac{3}{8}$ in. by $2\frac{9}{16}$ in.

The voltmeter and wattmeter are the dynamometer type. The ammeter is the iron vane type.

The windings are magnetically shielded and a new design air damper has been applied to facilitate quick readings.

Daylight Pays! So Does Benjamin Lighting

Shallow Bowl Reflector with Type "N" neck for any standard 2¼ inch shadeholder.

Deep Bowl Reflector with Type "B" holder for any standard brass socket.

Angle Reflector with Type "P" holder for direct attachment to porcelain sockets.

Benjamin
PRODUCTS OF CANADA

YOUR best light, provided by the sun, costs you nothing. Benjamin light, which rivals the sun, costs you less than haphazard, taken-for-granted systems because it reduces spoilage and accident and increases production.

Benjamin
Shade Holder Reflectors

are made for attachment to standard sockets and Benjamin Sockets. They comprise all necessary shapes for distribution needs. They include reflectors with porcelain enameled steel, aluminized steel and paint enameled steel surfaces.

You can fit Benjamin Reflectors to your present lighting system and get immediate results.

Benjamin illuminating engineers are prepared to help you. The accumulated lighting data from our years of experience are at your disposal.

Every Man From Factory Employee to Employer A Booster For The Motor Dealer

The reliable operation of R & M Motors enlists the goodwill of every man in the factory where they are used.

The owner who makes larger profits, the superintendent who finds it easier to maintain production schedules, the millwright whose upkeep worries are reduced, the machine laborer whose output and earnings are increased—all speak a good word for the motors which increase their efficiency and for the dealer who sells them.

This is one reason why dealers find R & M Motors easy, profitable sellers. Another reason is that the R & M Motor and its service reliability are generally known to prospective new motor users as well as to experienced users of electric power.

Dominant advertising in the leading general magazines which has continued consistently year after year for a decade, had made the Robbins & Myers Motor favorably known to nearly everyone—the man who has not yet bought his first motor and the large motor user alike.

The service reliability and known quality of the R & M Motor combine to produce a profitable, growing motor business for the R & M dealer.

"Daylight Saving" Has Claimed the Shaded Area

The load curve above is typical of the changed condition of the evening peak brought about by "Daylight Saving" Time. It probably approximates your own situation and you have no doubt already given serious consideration to its meaning in dollars and cents. But what are you **doing** to remedy this condition?

The proposition is simple. You have lost some load due to "Daylight Saving"—load that cannot be gotten back. The next best thing then is **other load**—preferably load that is as nearly profitable as that which has been lost. And a **Hughes Electric Range load comes as near to being the solution as anything that it is possible to secure!**

Never before has the Hughes Electric Range been so important **economically** as it is today. Never has it offered such tremendous possibilities to the nation as a conserver of food, fuel, transportation, time and labor. And never before has it held out greater advantages to central stations as a load builder of **certain** revenue earning power! Now all of this is amplified by a new National Time which has made a new "valley" in the station load curve—a gap that more than ever indicates the advantages of a Hughes Electric Range load.

The St. Lawrence Power Co. Demands

Comparatively little progress appears to have been made toward a decision in the matter of the application of the St. Lawrence Power Company for permission to construct a deflecting weir in the St. Lawrence River at the Long Sault. The Canadian Government takes the stand that it is a matter for consideration by the two countries involved and that it is without the jurisdication of the International Waterways Commission. On this basis it is argued that the proposed works would be in direct contravention of existing treaties. The feeling is general in Canada that the St. Lawrence Power Company, which is a subsidiary of the American Aluminum Company, is making the plea of war exigency to secure concessions which would not be considered under normal conditions. No doubt the suggestion that the consent of the Canadian Government would be forthcoming on condition that the work be removed within a year after the ending of the war is born of this thought. Considering that the cost of the weir is only estimated at $125,000, as compared with assets of this company probably running into around one thousand times this amount, the scrapping of the work would cause the company no financial inconvenience. The argument that the whole thing is just a "power grabbing" scheme seems to be further borne out by the fact that this company has large blocks of undeveloped power at different points in the United States; for example, on the Tennessee River, where it is estimated some 400,000 horsepower is running to waste.

Canada seems to have both law and justice on her side in demanding that when the St. Lawrence River is developed it shall be in such a way as to conserve the rights of both nations. The war necessity plea is the natural argument of an opportunist and must not pass without the most thorough investigation.

The T. E. L. Co. and its Steam Reserve

It is only on rare occasions that the daily papers essay to discuss technical matters and on those occasions there is generally an evident effort to advise themselves beforehand of the facts of the matter, but it is the exception that proves the rule and in a recent editorial the Toronto Telegram has gone out of the way to demonstrate that in matters about which it knows nothing it can draw most ridiculous conclusions from events and circumstances that, on the face of them, point in quite a different direction.

Some days ago the cars of the Toronto Street Railway Company were stalled for some time following trouble on their Niagara lines. Now everybody, including no doubt the Telegram, knows that such troubles, in the present state of the art of electrical transmission, are inevitable. The Hydro lines, as the Telegram well knows, frequently give trouble and greatly inconvenience not only the general public but, during the past year or two, the industries, both essential and non-essential over the whole province. The city of Toronto has, of course, experienced its fair share of this Hydro trouble and time and time again, as the Telegram doubtless knows, Toronto factories producing war essentials have been without the necessary power to operate their plants because of trouble at the Falls or on the lines between the Falls and Toronto. Everybody realizes that a steam reserve would have been the salvation of Toronto munition plants on numerous occasions.

In all these years the service of the Toronto Electric Light Company has been almost perfect. For example, a householder who uses their service for electric cooking in his home is authority for the statement that in the last four years his culinary arrangements have been interfered with on only one occasion—one isolated breakfast. In all these years the street railway service has never failed except for a duration of a few short moments. An unbiased review of these facts would seem to indicate that the steam reserve of the Toronto Electric Light Company, and their reserve storage battery plant, might be largely responsible for their excellent service.

But at last the Toronto Railway Company has failed to live up to previous standards. Why?

The answer, strangely enough, is given in full on another page of the same issue of the Telegram in which the editorial already referred to occurs, but evidently and unfortunately was overlooked by the editorial writer. It is pointed out, there, that some time ago Power Controller Drayton issued an order requiring the Toronto Electric Light Company to operate its steam plant for war industries and that, in consequence, this plant no longer constitutes a reserve power. It is further pointed out that through all the trouble on the line, which left the cars in part stranded, this plant was operating at full capacity, carrying essential industries. As a matter of fact the storage battery plant would have been utilized for the same good work had it been suited for this purpose but, in reality, it served the essential purpose of continuing the main arteries of the railway system in operation so that the inconvenience to the public was infinitely less than it would have been if this small part of the reserve had not been available.

So these are the arguments which, in the wisdom of the Telegram, absolutely condemn the use of a steam reserve. Essential industries carry on without interruption; street railway operated in part where, without reserve, everything

would be at a standstill. The Telegram appears to have small respect for the intelligence of its readers to expect them to follow such reasoning and, indeed, if we did not consider the management of this paper above such suspicion, we should be inclined to think that the editorial was written with some ulterior motive. However, there are the facts and we are satisfied to leave the whole matter to the good sense of the readers of the Telegram and to our own readers. There are valid arguments, in normal times, both for and against a steam reserve but no stronger reasons for its existence at the present time, and in the present case, could possibly have been put forward than those so prominently condemned in this illogical editorial.

Emergency Power Plants for War Work

T. W. Simms, chairman of the House committee on interstate and foreign commerce, has introduced in the U. S. House of Representatives, a bill to be known as the Emergency Power Act, which calls for the expenditure of $200,000,000 for the purchase and building of power plants. One clause of the bill empowers the President:

"To construct at any place or places within the boundaries of the United States such power plant or power plants as he may deem necessary, and in connection therewith to construct within such boundaries plants for the production of gas, coke, toluol, benzol, coal-tar products, and any other useful products that may be produced through or in connection with the coking of coal or lignite, or through or in connection with the combustion of any fuel."

It does not appear to be the idea of this bill to provide for the erection of hydro-electric plants, as this would take too long a time. However, a number of plants will be purchased or placed under the control of the government and enlarged or improved where this can be accomplished cheaply and quickly; also it is planned to erect a number of steam plants in coal bearing areas for immediate power production. By the expenditure of this money, the U. S. Government believe they will be in a position to produce the necessary war products in a minimum of time.

The Commercial Department in War Time

Mr. W. B. Johnson, manager of the new business department of the Montreal Light, Heat and Power Consolidated, read a paper on "The Commercial Department in War Time", at the convention of the Canadian Gas Association, held in Montreal. There were some points in the paper which are of interest to electrical as well as gas men. Mr. Johnson discussed the question as to whether companies should have discontinued commercial work after the outbreak of war. His company, said Mr. Johnson, had not found it necessary, nor advisable, to change the policy in this respect. It had been working for years on the principle that the new business department should be self-supporting and he was glad to note that so many companies were now seeing the wisdom of this policy and adopting it, although many formerly ridiculed the idea. He believed that every dollar earned by the commercial department should be spent for the promotion of the business and the obtaining of the goodwill of the public.

In the adoption and carrying out of such a policy there were many things that must be considered and which were governed by local conditions. The methods followed by one company might not prove successful in another city, so that local conditions should be studied before adopting new methods or systems.

Mr. Johnson then enumerated some of the problems of his own department. One was that the Montreal Light, Heat and Power Consolidated was a combination company and had the keenest competition to deal with, so that fully 75 per cent. of their energy was devoted to securing electric contracts for which the commercial department received no direct credit. Then the securing of desirable French-speaking salesmen was far harder proposition than one would suppose. The leasing laws, under which all moving was done in the first three days of May, handicapped the company in the matter of doing the regular work in the last half of April and the first half of May, the staff having to devote themselves to taking care of those moving.

The company was a firm believer in branch offices and showrooms. While these were opened for the "convenience of our customers" for the payment of bills and the application for service, they must show enough profit on appliances sold to be not only self-supporting but to leave a surplus to apply to other expenses of the new business department.

Since the opening of the company's new store on St. Catherine Street West, the company had added to its lines of neutral goods. The company, however, did not handle anything but allied lines such as pyrex glassware, aluminum cooking utensils, casseroles, percolators and teapots for gas ranges. Like most other companies they had lost considerable gas business to the electric due to the fact that it had not carried a suitable line of coffee percolators for gas ranges. There was no question that the electric percolator had been the means of converting a great many people to the use of electricity for various purposes.

The securing of goods and the steady increase in prices had been a great hindrance to the commercial departments but the companies' selling prices had been advanced to keep pace with the enhanced costs.

Safety Memoranda

The Ontario Safety League are distributing the following timely item:

We have noticed a large increase in accidents along Electric Railway tracks, especially on grades.

We have investigated a number of these accidents, and find that one of the most fruitful causes is the common practice among drivers of automobiles and other vehicles, of keeping on the tracks unnecessarily, or of driving alongside and stopping close to the tracks.

This practice is particularly dangerous, on account of the increasing width of the railway cars, and the increasing congestion of this branch of traffic.

Six feet at least, from the tracks, where possible, should be allowed to permit railway cars to pass with safety to vehicles and the passengers of both.

The League is asking the co-operation of railways and drivers of all vehicles, in this matter, and is posting notices asking drivers to keep off the tracks.

Any assistance you may be able to give us in the prevention of accidents of this nature will be very much appreciated.

Ontario Safety League.
J. F. Wyse,
Organizer & Engineer.

Illuminating Engineers to Discuss War-time Lighting Problems

The Illuminating Engineering Society will hold its annual convention at the Engineering Societies Building, 29 West 39th Street, New York City, October 10th 1918. War-time lighting economies, the use of better lighting in speeding up war production and manufactures, the lighting of camps, effect of lighting curtailment on crime, and automobile headlight legislation will be among the subjects to be discussed by lighting authorities of national reputation.

How the Electrical Services Were Affected in the Halifax Disaster

The Explosion and the Telephone

By Mr. W. H. Hayes*

The plant of the Maritime Telegraph & Telephone Company, Ltd., comparatively speaking, received little damage outside the area in the vicinity of the explosion, and otherwise was in full operation shortly after the explosion occurred.

All the buildings of the company were more or less damaged. The "Lorne" central office building most of all, it being in the north end of the city.

Local and Long Distance Lines Wrecked.

All the poles, cables, wires and telephones in the devastated area were of course almost wiped out of existence, and those that were not were so broken and tangled up with electric light and power wires, they were of no further use. The long-distance lines of the company passed right by the spot where the ill-fated boat exploded, and were on poles 35 to 40 feet in height, along with the wires of the Western Union Telegraph Company. A gap of one mile was blown in this line of poles.

The "St. Paul" central office building, located in the centre of the city, had the majority of its windows blown in, as also the head office building located near by, a number of the employees being more or less cut about the hands and face with flying glass. The "Harbor" central office building, located across the harbor in Dartmouth, had all its doors and windows blown in, but no one was hurt.

The company had just completed a fine new central office building on Sackville street, opposite the Citadel Hill, which they have since occupied as the "Sackville" central office, replacing the old "St. Paul" office. This new building had all the doors and windows blown, some out and others in. It had just been fitted up with the latest type of switchboard and would have been put into service two days later. While the explosion delayed the putting of it into service, it also forced the change to be made at the very first opportunity, owing to the congestion in the old office. The change was therefore made on the night of December 22nd, two weeks after the explosion. A staff of Northern Electric Company's men were at work in this building when the explosion occurred, finishing up the work of installing the new equipment, and some of them were very badly cut with the flying glass. A great deal of the glass in small particles got into the fine parts of the equipment, necessitating a great deal of tedious work to remove.

With the exception of two of the young lady operators, who were off duty at the time, and who were instantly killed at their homes, all the employees of the Company escaped serious injury and were soon at work again.

Switchboard Equipment Escapes Damage.

The fact that none of the equipment in the way of switchboards, etc., in the central offices sustained any damage, enabled the company to restore the service to most of the subscribers not in the devastated area, with very little delay. It is not likely there would have been any interruption whatever to the continuity of the service, except for the report circulated immediately after the explosion, that another explosion was imminent, and the order for every one to get out into the open. This caused every employee to flee for safety along with the rest of the population, leaving the switchboards to run themselves. This condition lasted for about one hour and a half, when word was sent around that all danger was passed. The operators and other employees then began returning to work in ones and twos until a full staff was on hand.

In the meantime the central office batteries had run down and required recharging. This could not be done until the power company turned on their current, which they were very loth to do owing to the possibility of starting fires through damaged wiring. However, after consulation with the City Electrician, Mr. Colpitt, it was decided to take the risk. Fortunately it caused no further damage and the switchboards were soon in full operation on the "St. Paul" office, but the "Lorne" office being in the area cut off by the explosion, it was two days before current could be turned on to charge the batteries in that office. Luckily the batteries had sufficient life to carry the load until the current was available.

In the "Harbor" office the battery charging current is supplied from Halifax by submarine cable across the harbour; this cable had been damaged and no current was available there. This was overcome temporarily by the installation of a complete gas engine and motor in one unit, which did the work until the current from the usual source could be supplied.

The first thing required was to get the openings in the different buildings closed up before night set in, and with quick and intelligent work on behalf of the staff was fairly well accomplished.

Telephone Connection with Dartmouth Severed.

The telephone connection between Halifax and Dartmouth is maintained by means of submarine cables carrying 100 wires. These cables were found to be working immediately after the explosion but not for long; they had been damaged but not enough to cut them off entirely. However the storms that came up right after completed the work, and the service was cut off between the two places. It was impossible to stop out on the harbour in order to take the cables up to make repairs, or to lay new cables, owing to the severity of the storm, which raged day after day. Consequently before the weather moderated a number of ships had been blown up and down the harbour, dragging their anchors to such an extent that they caught in the cables, and twisted and shifted them about so that they were completely ruined and unfit for further use. Fortunately a new 100 wire cable was already in stock and as soon as it was possible to do so this was laid across the harbour, but a week or ten days had elapsed during which time Halifax and Dartmouth were telephonically severed.

After getting the operating force at the switchboards and the opening in the buildings closed up temporarily, attention was next turned to getting the Long Distance Lines in working order. It was impossible to rebuild the blown away part of the pole line owing to the fires which were raging and the rescue work going on, even if the help and material had been available, which it was not. Some other means had to be found to bridge the gap and that without

*Assistant Manager Maritime Telegraph & Telephone Co.

delay. This was done by connecting all the Long Distance lines where they pass through Rockingham, about three miles north of the centre of the City, on to the local suburban lines running in that direction, which enter the City via a different route to that of the Long Distance lines, and which were not damaged by the explosion. This temporary arrangement enabled the Company to place its main Long Distance lines into service the next day after the explosion, and to superimpose on one of them a telegraph circuit through to Boston for the Associated Press service, which carried the first full account of the disaster to the outside world.

A piece of iron from off the doomed boat, weighing about 25 lbs., came crashing through the roof of the "Lorne" central office building and landed about two feet from the operators, embedding itself in the floor. It just escaped the switchboards by about two inches. This building at first sight appeared to be a total wreck; all the windows gone and many of the doors; the back part of the building being broken away from the front part, and daylight could be seen through the walls in many places. Bits of boards, canvas, cotton and every conceivable thing that could be got were used to close up these openings. Even the window blinds were torn down, those that had not been blown down, and used for this purpose. When the blizzard came the next day the staff suffered considerably from lack of heat. It was impossible to keep the building warm with the regular heating apparatus owing to the drafts blowing through in every direction. Temporary stoves were obtained as quickly as possible, and more permanent repairs were made speedily. Only in this way was it possible to get along and keep the staff at work.

The number of telephones lost and destroyed were between 800 and 900, and all in the devastated area. The total direct cost of the damage to the Company will be about $65,000. The indirect cost, that is, the expenditures the Company will be compelled to make owing to changes being forced upon them on account of the explosion, will probably be over one hundred thousand dollars alone.

The outstanding feature of the work was the loyal self-sacrificing work of the operators at the switchboards and the repairmen who had to face the awful weather and keep it up day and night. The operators were at the switchboards continually, their meals were brought in to them, and at first it was necessary to supply them with sleeping accommodations. Owing to the severe weather conditions, and no street cars in operation it was necessary to convey the staff of about 80 operators to and from their homes or places of refuge. This work of course had to be performed by the men of the staff, with motors, sleighs or any form of conveyance possible to obtain that would answer the purpose.

The extra demand on the service was enormous; the Relief Committee, the temporary hospitals, railway and others all wanted additional and special service to assist them in their humane work of helping to relieve the suffering. Lines had to be built, telephones installed, and also a number of private switchboards were wanted to properly take care of the vast amount of calling. Hundreds of people did nothing else all day long but sit with the telephone calling and receiving calls, and when necessary to leave others took their place and thus kept it going. It was all supplied and the service rendered as well as it was humanly possible to do so.

Electrical Installation and Repairs

Halifax in pre-war days could never be called a well lighted city, although some attempts had been made to introduce modern lighting into the business districts, but with war regulations in force street lighting was greatly curtailed, and aside from a stray arc lamp and the light from show windows, streets were dark. The explosion of December 6th finished the street lighting, as practically every window in the city was destroyed, and consequently all store doors and windows were boarded up and the meagre light from these sources cut off. The explosion badly damaged the light and power lines of the Nova Scotia Tramway Company, and they were practically wiped out in the devastated area, although in those districts of the city where their poles were left standing, they made very quick recovery, and with emergency gangs accomplished wonders in a very short time in the matter of restoring these services.

Naturally all repair work was sadly handicapped by the necessity of workmen having to look after their missing relatives and friends, getting the injured to hospitals and providing some protection for their families and many of the Tramway Company's employees, including foreman and inspectors, were either killed or injured. The blizzard of Dec. 7th and succeeding days tied up all transportation and held up repair work on the lines, as well as causing additional serious damage; street car traffic was utterly demoralized for days and the task of getting the roadways clear and the lines in working order was herculean.

Darkness Hampers Relief and Repair Work.

The lack of light in the north end of the city was a great drawback to those engaged in rescue work, and the available supply of Daylos was quickly in use. Many of the automobiles engaged in the work carried a supply of candles for the use of householders who were without light of any description, and those trying in the darkness to effect temporary repairs to their homes.

After the urgent rescue work had been attended to, the first great rush, as far as the electrical houses were concerned, was the supplying of lamps and effecting necessary repairs to the equipment in the hospitals, shelters, bakeries, groceries and household furnishing stores; followed by the equipping of churches, basements, schools and any available place, as temporary homes for hundreds of families. With the rush of hospital, relief and repair parties to the city, it was necessary to equip any vacant buildings which were suitable, as camps, bunkhouses and dining rooms and the available electrical workers in the city were far from sufficient to look after this necessary work, and many were brought in from outside places, Montreal and Quebec supplying the major portion.

As soon as the relief work was thoroughly organized and put on a permanent working basis, the matter of erecting temporary homes for several hundred families was taken up energetically and, approximately, a thousand flats have been erected and furnished in a very comfortable manner for the use of those who lost their homes, until such time as the damaged houses have been made habitable, or new ones erected. The damage done to the interior of the houses throughout the city and which externally appeared to be in good condition has been enormous and the plaster in a large perecentage in the houses in the city has fallen, or has been damaged to such an extent as to make its removal necessary. This necessitates a very great deal of electrical repair work, especially in the older houses where the installations are far from modern, and the city inspector now insists that wherever it is necessary to remove the plaster, all electrical installations be made perfectly modern and up to a standard that will comply with the latest regulations of the Board of Fire Underwriters.

There are many hundreds of jobs of this nature to be done in the city, as well as the installations in the new modern and hydrostone houses being erected by the commission. A great deal of electrical work is being called for in connection with new buildings being erected by the Military and Naval authorities and by the Railway, in sheds, docks,

passenger station and car cleaning plant, and a very great deal of work in buildings being erected or enlarged for commercial purposes and in connection with the enlarging of the dry dock and the erecting and equipping of the plant of the Halifax Shipbuilding Company. There is not sufficient electrical labor to handle this work and great delays are being occasioned thereby. There are splendid opportunities at the present time for a large number of competent wiremen and linemen and splendid wages with abundant opportunity for working all the overtime they desire at inflated rates.

Fire Alarm and Lighting Service

The explosion resulted in serious damage to the fire alarm and the lighting systems of the city. The former was put completely out of commission. The storage battery, which supplied its energy was thrown from the racks to the floor by the concussion, and the circuits were all broken down, in many places in the city. In the devastated area signal boxes were all destroyed, some of them being carried over 100 yards from their original positions. The immediate difficulty was to establish a service of some character, and in order to do this it was necessary to have current. Fortunately Dalhousie College had a set of batteries of a type used for this purpose, and Mr. P. R. Colpitt, the city electrician, was able to borrow it. There being no means of direct communciation with places outside the city an order was placed, within an hour from the time of the explosion, with the Northern Electric Co. for new equipment. The company took energetic action, and immediately sent to the nearest point out of the city where it was possible to get in communication with outside wires in order to rush the order through. With the help of Dalhousie College and of some Northern Electric men who happened to be in the city, the city electrician was able to get a part of the system in working order the second day after the explosion. The greater part of the system however, had to be carefully gone over, as, due to concussion, many boxes were out of adjustment and would not respond quickly to the alarm.

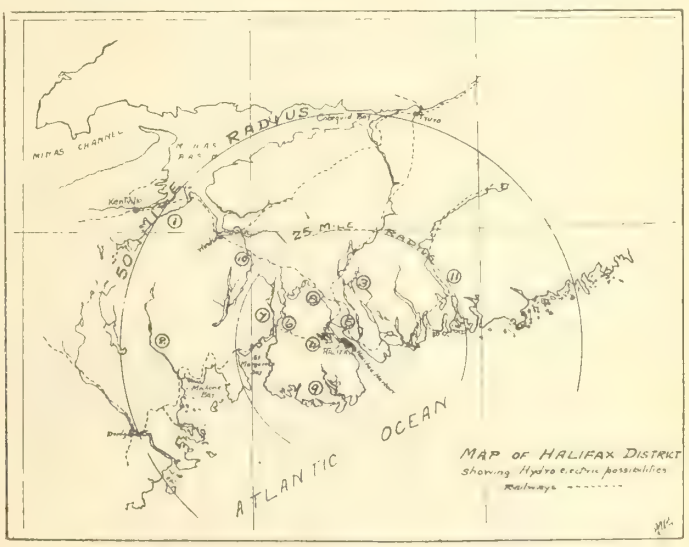
The electric lighting service was completely demoralized but after patrolling the business section of the city, energy was turned into the lines in the afternoon of the day of the explosion. The light service in the devastated area was entirely destroyed, the poles, (which carry the lighting and street railway wires)—being broken, and the wires thrown down, including the portion of the high tension line serving the town of Dartmouth. Pending the new lay-out of this part of the city by the Relief Commission, nothing has been done towards reinstalling the lines. The plans of the Commission are to establish an underground service in the district referred to, with ornamental poles for street lighting. The city is negotiating with the Halifax Power Co. with a view to the street lighting being undertaken by that company, with energy from a water power on the North East River, 18 miles from Halifax. If these negotiations are completed the city will be equipped with about 1,000 lamps, consisting of luminous arcs and nitrogen incandescent lamps of different capacities, the large ones for the business section and the small ones for the residential districts. The present system consists of a series of enclosed arc lamps.

The outside wiring situation throughout the province has been put under the charge of the Provincial Public Utilities Commission, which is preparing a set of rules to be shortly issued to all companies. This will result in the line work being greatly improved and standardized throughout the province, where climatic and other conditions are exceptionally severe.

Hydro-electric Possibilities of the Halifax District

By Mr. G. E. Booker

It will probably be of interest to those who know little of Nova Scotia, to learn that within a radius of fifty miles of the city of Halifax there are no fewer than eleven rivers and streams capable of developing a total of some seventeen thousand horsepower.



None of the developments are large, due to the comparatively small watersheds of the respective rivers; but owing to the rugged nature of the country, effective heads of from fifty to two hundred feet and over are obtainable. Up to the present time, however, practically no use has been made of this water power, in fact only one stream is developed to anything like capacity, and that is only equal to about three hundred horse-power. Although there have been a number of schemes drawn up within the last few years, nothing has up to the present materialized.

The Halifax Power Co., Ltd., has the construction of its first unit on the North-east River under consideration, and hopes to have same completed at an early date.

The demand for cheap electrical power is one of vital importance to this locality, not only in the encouragement of new industries, but as a means of fuel conservation. The attached list of rivers and streams in the locality, together with the power capacity of each, is compiled from the Progress Reports of the N. S. Water Power Commission, the activities of which body are under the efficient direction of Mr. K. H. Smith, resident engineer for the Dominion Water Power Branch.

Hydro-Electric Power.

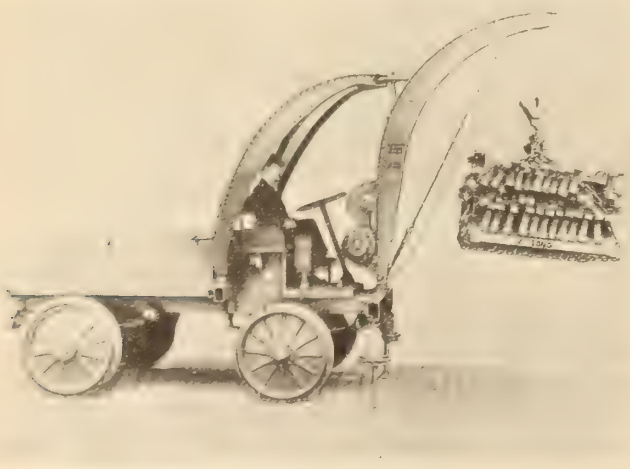
Several of the smaller municipalities in the Province are also contemplating the development of Hydro-electric power

Hydro possibilities in vicinity of Halifax

for lighting and power purposes, as the advanced cost of fuel has greatly increased the cost of operating the existing small steam plants. Unquestionably every stream which can be utilized for power purposes economically should be developed now; as it is only by thus making preparations for increased industrial activity after the close of hostilities that can we hope to be in a position to compete with our manufacturers in the world's markets. In this connection it may be pointed out that Great Britain had up to the outbreak of the war only three small Hydro-electric developments, aggregating only some three hundred and fifty horse-power. Since that time,

However developments capable of an output of about eleven thousand horse-power have been constructed by private parties, and further additions aggregating some seventy thousand horse-power are under consideration, as a means of obtaining cheap power for manufacturing purposes and of conserving fuel.

A bill dealing with the water-powers of Nova Scotia was passed during the last session of the Legislature which should in some degree assist in the economic development of these water-powers; and although it is doubtful whether an immediate market could be found for the total power available it can safely be stated that, with the promised industrial expansion of the locality, the demand for electrical energy will very rapidly outgrow the supply.



List of Power Possibilities of the Halifax District.

Ref. No.	Name of river.	Approx. distance from Halifax.	H. P. available at turbine shaft.

Electric Vehicle Crane Tractor

By A. Jackson Marshall

A Chicago manufacturer of electric vehicles recently placed on the market, in response to a demand from terminals and manufacturing plants, a tractor equipped with a two-ton capacity crane, also operated by electric motors, and supplied with current from the same storage battery used to propel the electric vehicle. The demand for this mobile electric tractor crane was created principally through war conditions and the consequent handling by such plants of many heavy materials in large units. Although it has not as high a lifting capacity as many locomotive and overhead cranes, it has, however, the advantage of being more flexible in its radius of action.

Vehicle and crane operated by storage batteries

Recently one of these tractors was observed unloading a freight car at a well known terminal. It was handling large crates of army kitchen equipment weighing approximately 3700 pounds. After lifting the cases off the freight car, it backed away, and running across the pier under its own power, depositing its load. While this is a somewhat larger load than the tractor was figured to carry while in motion—the manufacturers would prefer loads to be limited to 2000 or 3000 pounds in such instances—the ordinary stationary crane having only a maximum capacity of 4000 pounds—the electric crane tractor performed its duty easily. The boom of the tractor swings 180 degrees so that after material is lifted it can be deposited easily on the ground or on a trailer for transportation elsewhere.

This electric tractor is also equipped with a spring drawbar coupler at the rear of the frame. It is possible therefore to load trailers by means of the electric crane and then haul these trailers electrically to another point and unload them. As a tractor it can haul a gross trailing load of fifteen tons. Electric tractors of this type have been used in many instances to "spot" loaded freight cars, either pulling or pushing them.

This tractor is another member of the electric vehicle family which embraces light and heavy duty commercial (street) trucks, passenger cars, electric wheel chairs, canoes, electric industrial trucks and tractors, including those equipped with cranes and self-elevating platforms, which are contributing no small part in our successful war operations, as they not only expedite the rapid and economic movement of materials and munitions, but, by virture of their gluttony for work, are releasing thousands of men otherwise needed. In fact many of these vitally necessary small but powerful electric vehicle transportation units are being operated successfully by women.

A New Commercial Application of Electrolysis

According to La Energia Electrica a new small industry has just been started in Valencia, Spain. In this district a large number of small decorative articles are manufactured in clay, glass, wood, and papiermache. Some of these are now being encased in a thin "skin" of metal, which greatly improves the appearance and permanence of the articles.

The method employed is simple. A small compressor supplies air at a pressure of about seven atmospheres to a receptable filled with metallic powder (generally lead, for cheapness). At the moment the metallic powder emerges from the jet, it is melted by an oxy-hydrogen flame, and a spray of molten metal encases the object to be "metallized", which is placed on a revolving platform. The object then goes to the electrolytic bath, and receives its new skin of copper, silver, or gold. Glass articles are first treated by a sand-blast to ensure the necessary toughness for the adhesion of the lead. A new type of Leyden jar is also being manufactured, in which the old silver-foil is replaced by a homogeneous film of silver.

Clothes That Hamper Action

If you hired a man to work for you and gave him a suit of clothes, it would be to your interest to see that his suit was not too tight, restricting his legs and arms and preventing him from doing proper work. Maybe at the end of a year you'd enlarge his clothes to give his bigger muscles more room. At any rate, it would be the last thing you'd do to hamper and hinder his actions.

It's the same with a franchise. It may hamper and hinder the street railway in giving you the best service. If it is cut according to the 1901 fashion, it will not do for 1918. The 1918 fashion may not do for 1930.

What is needed is a garment that will allow for the natural expansion of the street railway as it is found necessary to meet the growing needs of the public.—B. C. Buzzer.

Labor Problem and the Electric Railways

Of Three Factors in Railway Operation, Employees, Public and Investor, Employees Come First—Their Co-Operation Must Be Secured and the Public Be Convinced That Good Service Demands Fair Pay

Street railway companies are being harassed in their operations all over the American continent by the increased cost of everything entering into the operation of their systems, chief of which perhaps is the cost of labor. Nor can the employee be blamed for the necessity that drives him to make ever-increasing demands. It is merely incidental that the labor shortage makes him independent—with the greatest imaginable surplus of labor supply, justice would require a much increased wage over that of four or five years ago. In view of these facts it seems to indicate a strange perversity of human nature that the public, in general, so insistently objects to any increase in railway fares. It is strange that the British ideals of fair play for which we are fighting to-day would not rather incline them to grant, without argument, the increase that has been arbitrarily demanded in almost every line of merchandising to-day—often without justice or real necessity.

Probably the reason lies in a lack of understanding, by the general public, of the railway situation. With the butcher, grocer, haberdasher et al, the public pays the added cost, for the most part willingly, because they have had the situation explained to them. Of course they had no choice anyway and perhaps this has helped to an understanding. But in any case it seems essential that the electric railway situation should be explained.

An interesting article by Mr. Britton I. Budd, president of the Chicago elevated lines, discussing the possibilities of a better mutual understanding between the companies, their employees and the public, appears in a recent issue of the Electric Railway Journal. Electric railways, he says, are to-day facing the most serious problems in their history. Conditions brought about by the steadily increasing costs of operation, due to the enormously advanced prices of materials and labor, with revenues limited by national, state and municipal regulating authorities, call for clear thinking and sane acting, if receiverships and industrial chaos are to be averted. Owners of electric railways must look forward, not backward. The problems confronting them must be met and solved in the light of present day knowledge and understanding, rather than by the experience of the past. Especially does this appear in dealing with labor problems, for methods which might have been applicable even ten years ago are to-day obsolete and out of place.

The Employees, the Public and the Owners

In the operation of electric railways there are three factors to be considered, namely, the employees, the public and the owners of the properties. Each factor is entitled to a fair return on his contribution toward the success of the enterprise, and each must be given consideration in determining what that return shall be. If one of the factors in this equation demands and receives more than its fair share, it must be at the expense of the other two factors, and this presents a condition which calls for an adjustment.

In my classification of the factors I have given the employees first place, because in many ways I feel they are the most important. If employees are reasonably well paid, if they are given the best working conditions which the character of the work will permit, they will be contented and will work and co-operate with the company. Such co-operation makes possible the best service to the public, which means a better return on its investment. If the employees and the public both are satisfied, the owners of the property are more apt to be satisfied, because operation under such conditions will be successful, assuming, of course, that revenues are sufficient to make a reasonable return to all factors.

Let us briefly consider what are the rights of each of the factors in this equation and their relations each to the other.

The National War Labor Board, in laying down certain general principles and policies to govern relations between workers and employers, has said: (1) "The right of all workers, including laborers, to a living wage, is hereby declared." (2) "In fixing wages, minimum rates of pay shall be established which will insure the subsistence of the worker and his family in health and reasonable comfort."

It will be observed that in laying down these general principles, the War Labor Board has not considered the financial condition of the employer. The inference is plain that workers are entitled to a living wage, and that the ability of the employer to pay that wage is not the main issue.

The owners of electric railways should face the situation squarely. Demands of employees for increased wages cannot be dismissed on the plea that the company is financially unable to meet them, even though that plea is literally true. Such a plea will satisfy neither the employees nor the public and it behooves the owners of electric railways to face about and seek ways and means of increasing revenues.

Railways are Not a Philanthropy.

At the present time wage demands have been made on many electric railways which if granted would mean utter financial ruin, unless ways are found for increasing revenues. If the electric railways wish to be regarded as eleemosynary institutions and sell transportation at less than cost, the employees cannot be expected to engage in such philanthropic enterprises. The public should not receive goods at less than cost, at the expense of those engaged in producing such goods, and this applies to the investment made by both capital and labor.

The term "living wage," which the War Labor Board has declared each laborer entitled to, is rather a loose term and ambiguous. It would, however, be impossible for any board to define in exact terms what constitutes a living wage. We find one man supporting a family in comfort on a wage which another man similarly situated finds altogether inadequate. A great deal depends also on locality. What might be a fairly adequate wage in one part of the country may not be adequate in some other section.

Labor Must Be Held in a Competitive Market.

The owners of electric railways, however, need not greatly concern themselves on that point. They must be prepared to pay wages relatively as high, all things being considered, as are paid in other industries, or they will not be able to procure the labor necessary to operate their lines. Many already are experiencing difficulty in this direction and the public suffers as a result of the quality of the service. However much we may differ in opinion as to what con-

[illegible] a fair rate of pay for employees of electric railways, [illegible] affect, I believe, that wages that were fair in pre-war times are not fair to-day, because the purchasing power of the dollar has materially decreased. We must recognize that fact and deal with our employees accordingly.

What are the rights of the public in the matter? What attitude should the public assume toward electric railways? The public is entitled to the best service that can be given for the price paid. In this respect the public often is short-sighted as it does not fully appreciate the relation of the service to the fare. It is impossible for any public utility company to give the best service unless it is earning a fair return on its investment. In other words, the character of the service must depend upon the price paid for that service.

Generally speaking, the attitude of the public toward electric railways and other utilities is not a fair one. While demanding more and more in the way of service, the public is unwilling to pay for what it asks and expects. Any suggestion of increasing rates for transportation usually meets with public opposition, regardless of the financial condition of the company. Prices of all other necessities advance, but to-day the price of transportation on many electric lines is actually less than it was ten years ago, although the service given has steadily improved

Where Do the Owners Come In?

The owners of electric railways are entitled to as square a deal as the other two factors in the equation. They are performing a great public service, for which many times they receive neither credit nor adequate return on their investment. Sometimes, perhaps, they are themselves to blame. Too often in the past the electric railways have taken a position of standing between the public and increased fares. They have met the demands of their employees for increased wages with the assertion that the rate of fare will not warrant any advance in wages, and they have appealed to the public to support them in that position.

This policy has never earned the good will and support of the public, while it has incurred the ill-will of the employees. The owners must adopt a policy of perfect frankness with their partners in the industry. They must first have a good case to present, as most of them have, and then they should see that it is intellingently and frankly presented. They have no right to expect their employees to accept lower wages simply because they are selling their product to the public at too low a price. Instead of flatly opposing reasonable wage demands on the part of their employees, they should bend their energies toward producing higher revenues and, by dealing frankly and openly with their employees and the public, they will have the co-operation of the former and lessen the opposition of the later.

Rate Advances are Generally Slow.

We all realize that it is an extermely difficult and slow propostion for a public utility company to advance rates. The manufacturer engaged in private enterprise meets increased wages or higher costs of materials by advancing the price of his product to the consumer. The burden is easily shifted. Not so with the electric railway company. It must be able to show the various commissions and boards, charged with the regulation of rates, that the increase asked for is justifiable. It is a matter of common knowledge that in some states, boards and commissions in making awards frequently are governed by popular sentiment rather than by the actual merits of the case. This makes it all the more necessary for public utilities to be frank and open in their relations with their employees.

Never was there a time as opportune for educational work on the part of electric railways as the present. They are absolutely essential to the successful prosecution of the war. The hundreds of thousands of employees engaged in war industries must be provided with means of transportation to and from their work. The public has grown accustomed to higher costs of every necessity, and the necessity for increasing wages is generally recognized, even if the scarcity of labor did not make such increases imperative in order to hold men in the industry.

Electric Railways Are an Essential Industry.

The importance of the electric railways in these war times is not yet fully appreciated by the public, but there is no one factor probably that is of more importance to the successful prosecution of the war than the electric railways, inasmuch as they serve practically every form of industry engaged in the manufacture of war munitions, ships, etc. In fact they are indispensable and it is most essential that their revenues be sufficient not only to enable them to maintain the best of service, but also to put in improvements and extensions to plants, shipyards, cantonments, naval stations and other war activities.

The banks, trust companies and insurance companies throughout the nation are large holders of the securities of electric railways, and conditions which would bring about depreciation of these securities would have a serious effect upon the entire financial structure of the country. Government officials realize the importance of the electric lines and have shown a disposition to deal with them fairly. This fact should be emphasized in every possible way, until the truth is forced upon the public mind. When the public is fully enlightened on the seriousness of the situation, the way will be paved for a comprehensive plan which may require national legislation to insure sufficient revenues to do justice to those who have invested their capital in electric railways and to enable the companies to perform the service which is expected of them.

In this campaign of enlightenment the employees of the companies, if fairly treated, will be found ready to co-operate. It is inexcusable to overlook the fact that the employees of the industry are a powerful influence in making public opinion. The question for the industry to determine in these critical times is how much of an effort it is willing to make to break down antagonisms that have existed too long and, in lieu thereof, to enlist the employees' help in working out the complex situation in which the companies find themselves.

The Annual Financial Review

The Annual Financial Review covering the year ended June, 1918, is just to hand. This is a carefully revised summary of facts regarding securities listed on the Montreal and Toronto stock exchanges and of other prominent Canadian corporations. It includes the current annual statements of companies, the highest and lowest prices of stocks and bonds on both exchanges for each month for ten years, the number of shares sold each month for the past fifteen months, rate of dividends paid for past years and other important items in the history of the different companies, such as increases in capital stock, particulars of franchises, when bonds are redeemable, dividends payable, etc.—information of value to any investor who wishes to make an exhaustive study of any particular stock before placing his order. The review comprises 740 pages of solid information, well printed in a clear and concise manner, and is neatly bound in full cloth. The work is most valuable not only to financial institutions, but even more to the general investing public, whose knowledge of such matters is necessarily limited. Published by Houston's Standard Publications, 84 Bay St., Toronto; price, $6.00 per annum, including any supplements that may be issued.

One Year's Experience with Automatic Rate System

By Harold W. Clapp*

The franchise of the Columbus Railway, Power & Light Company suburban line to Westerville, 13 miles from Columbus, is based upon the premises, first, that a community should say what it wants in the way of service, and second that it should pay for such service. The past year's experience is described in Electric Railway Journal by Harold W. Clapp, general superintendent of the company. Briefly, the company is allowed under this franchise to earn 6 per cent. upon the value of the investment fixed by arbitration, and 8 per cent. upon new capital. The County Commissioners, acting through a street railway commissioner, have the right to prescribe conditions of service, and the company is in duty bound to provide the prescribed service.

Flexible Fare Automatically Adjusted

A sliding scale of rates of fare is provided, automatically adjusted with the fluctuations in the working capital, as was provided in the Tayler ordinance in Cleveland. In fact, the Westerville franchise is in general based upon the Tayler ordinance, which provides a most logical and workable mechanism for insuring a fair return upon the investment in electric railway properties with the exception that it imposes a fixed maximum fare. The recent law enacted by the Massachusetts Legislature, by the way, eliminates this weakness by always insuring four steps in the fare scale above or below the step established at any time.

In the case of Westerville, the sliding scale of fares is as follows:

(a) Four tickets for 10 cents, or 2½ cents fare.
(b) Five tickets for 15 cents, or 3 cents fare.
(c) Ten tickets for 35 cents, or 3½ cents fare.
(d) Five tickets for 20 cents, or 4 cents fare.
(e) Ten tickets for 45 cents, or 4½ cents fare.
(f) Five tickets for 25 cents, or 5 cents fare.
(g) Ten tickets for 55 cents, or 5½ cents fare
(h) Five tickets for 30 cents, or 6 cents fare.

The cash fare is 5 cents a zone except under (f), (g) and (h), when it is 6 cents a zone.

Operation under the franchise began on Aug. 1, 1917, under schedule (d) with a ticket fare of 4 cents or five tickets for 20 cents. Soon afterward a commutation book was provided for six and seven-day regular riders, giving them two rides each week day or every day, as the case might be, at 3¼ cents a zone. The only limitation on the use of this book was set by the dated tickets, each coupon bearing the date upon which it might be used.

The public control of the service on the Westerville line lies in a street railway commissioner, appointed by the body that originally granted the franchise, the County Commissioners. His salary is paid by the car riders of the Westerville line, as it is charged against them in the operating costs.

The control of the service includes the right on the part of the street railway commissioner, acting for the public, to fix and alter car schedules, increase or diminish the service, propose extensions, betterments and permanent improvements, and approve or disapprove the same when proposed by the company. In short, he represents the car riders in all things affecting service and the cost thereof.

Operations under the Westerville franchise have been carried for more than a year. At the end of the eleventh month, which was June 30, 1918, the working capital had shrunk from $25,000 to $15,087.69. This would indicate that the rate of fare maintained was too low. It is altogether likely that by September 1, at the very latest, with all accrued accounts adjusted, the working capital will have shrunk below the $15,000 mark. At that time or thereafter as that fact can be officially determined from the reports of operation, the fare will automatically increase to the next higher rate, which in this case is 4½ cents per zone. Commutation rates will follow the upward trend and instead of being at the rate of 3¼ cents per zone the tickets will be sold at the rate of 3¾ cents per zone.

Local Street Commissioner Is Doing His Part

During the past year John Scott, the street railway commissioner, has been constantly "on the job" of watching the service and making inquiries and suggestions. It must be remembered that this road is a small operation, as electric railways go, and that Mr. Scott as commissioner took hold of it at a time when it had been a going concern for twenty-five years. The possibilities for suggested changes are not so numerous as they would be on a more extensive transportation system. Nevertheless, Mr. Scott has found opportunity to serve the public most efficiently. He has taken particular pains on many occasions to go to Westerville, which is 13 miles from Columbus, and hold meetings and conferences with the city commission and with the Chamber of Commerce and with them go over the reports rendered him monthly by the company. These reports, by the way, show the financial results for the previous month; they are made in great detail to the commissioner by the 15th of the following month and follow the official classification as to form. A condensed statement from this report is printed on a bulletin and hung in a neat frame in the Westerville cars each month and also sent to the Columbus newspapers and to Public Opinion, the Westerville local newspaper. Publicity is the real watchword of such a plan of operation.

In the early part of the year the commissioner made special efforts to see how the newly-arranged zone worked out so far as accommodation of car riders was concerned. He called for only one change during the year and that was in the case of a church located 600 feet from the end of one zone, and he ordered the cars to change this zone limit on Sundays for the church goers only. The use of the line as a freight line by the merchants of Westerville would be greatly increased if a better located terminal for receiving freight could be had at the Columbus end. The company had been for a long time trying to find such a terminal but in vain. Mr. Scott has been striving to the same end. In many other minor ways Mr. Scott has made suggestions and inquiries. He is just at this time commencing the most important move for his car riders, in attempting to get the taxes assessed against the Westerville line reduced to a more equitable basis. The Westerville car riders are paying about $9,000 a year taxes when in all fairness they ought to be paying about $3,000. Mr. Scott has the county commissioners and the county attorney behind him in the fight that he is planning on this point.

Railway managers might as well face the fact that the time is here when the public ought to, and is going to, dictate electric railway service. The public is going to insist, in fact is insisting, upon saying when, how and where cars shall be run. I say, let the public do so if it pays for the service.

There would be no trouble about this phase of it except for franchise restrictions on rates of fare. There's the rub! No progress is possible until the old contracts are voluntarily abrogated or rendered null and void by the rulings of commissions, when such bodies have rights superior to those

*General Supt., Columbus Railway, Power & Light Co., Columbus, Ohio

[illegible] matter. Where mine palaces alone [illegible]

Zone System Only Just Plan for Large Cities

[illegible] necessary on a line like the Wester- [illegible] it is advisable in city operation must [illegible] local centers. The shape of a city and [illegible] all business centers have more to do with this question than mere population. Real estate developments, usually allowed to locate without regard to anything except the profits of their promoters, often produce abnormal situations where the installation of the zone system is necessary. I have observed that when an American city gets above, say, 500,000 in population, the zone system is the only just one for both public and the company. It is likely, in my judgment, to make headway in this country in the years immediately after the war, when it may be found that a much higher price level will exist than is popularly predicted now. The zone system will make it possible to place upon the shoulders of those getting the benefits the cost of operating lines that would be unprofitable as part of a flat-rate system.

But whether a flat rate or a zone is used, the fare ought to be flexible or follow a sliding scale. The time has gone by when cities or companies are going to get each other by the throat with a fixed fare. Any community is interested in service first—what it shall be and how it shall be rendered. The public is also learning that it is interested, for selfish reasons, in the ability of its electric railway to provide that service, and to grow not only with the town itself but also with changing methods of conducting transportation. It begins to be apparent to both sides that the price of service cannot be, safely for either side, fixed for a term of years.

The provision for a sliding scale in Westerville takes care of fluctuating costs, downward as well as upward. It is done in this way: A total of $25,000 of the capital of the line was in cash and was termed the "working capital fund." All the surplus at the end of each month, after paying operating costs, maintenance, taxes and interest at 6 per cent. on the capital invested ($300,000 in this case) is paid into this fund. When the working capital fund increases to $35,000, the next lower rate on the schedule may be ordered into effect by the street railway commissioner; when it shrinks to $15,000, the next higher fare may be installed by the company.

Get an Automatic System Now

The whole matter of fares is complicated at present by the fact that many of the electric railways do not appear to know what they want in the way of a permanent settlement. One company asks for an increase of 1 cent, and another for 2 cents. A third wants a charge for transfers, and a fourth prefers the zone system. It is understood in all cases of appeal for emergency relief that any relief given now will be temporary if operating conditions continue to become more and more strenuous. Obviously the wage increases are constantly demanded, as material prices mount skyward, as interest rates go up, there must come a time when another increase of fare will be asked for. On the other hand, it is conceivable that prices might go down, leaving the rate of fare too high. Then the public must go through a process the reverse of that instituted by the companies when they appealed for higher fares.

In other words, under the present general plan there will be a seesawing up and down, with somebody always appealing for something. Why not take the bull by the horns and throw him—that is, make now the effort necessary to institute an automatic system, fair to everybody, and dispense with all this appealing, which is a constant source of irritation?

If this plan is followed it may, in many cases, be necessary for holders of stock to consent to a considerable reduction in its volume. It is better, however, to have less stock of a marketable and dividend-earning character than the greatly depreciated, sluggish stock which characterize so many properties and which a man would be called a fool for buying. In Cleveland, where the stock total was cut, the stock is now owned by many times as many stockholders as formerly, and it is a gilt-edged investment.

The only way out, in my opinion, is a service-at-cost system. This plan removes the veil of mystery from the finance and the operation of a public utility. The community immediately realizes that the utility stock is a safe investment because the community has in effect guaranteed the security. Being aroused to an interest in its public utility, the community thereafter invests its savings in it, and the final step is a long move toward co-operative ownership and a boosting instead of a knocking community.

Is this not what the management of public utilities should be trying to secure?

Personal

Mr. W. H. Morton, formerly secretary of the National Association of Electrical Contractors and Dealers, has been appointed general manager of the organization.

Mr. Fred J. Pratt, for sixteen years storekeeper for the W. E. R. Company has been appointed purchasing agent to succeed Mr. Mackenzie. Mr. D. Roche, for twelve years chief clerk to Mr. Pratt, has been made storekeeper.

Mr. Lawrence Palk, assistant to the General Manager of the Winnipeg Electric Railway Company has also been appointed assistant secretary of the company as well as secretary of the Winnipeg, Selkirk and Lake Winnipeg Railway Company. Mr. Palk has been with the company for 14 years in a secretarial capacity.

Mr. G. A. Henson, who for the past three years has been assistant treasurer of the Winnipeg Electric Railway Co., has resigned after eighteen years service. Mr. Henson's initiation into street railway transportation dates back to 1890 when for five years he constituted the whole office force of the old horse car company. When the horse cars went out of business in 1895 he entered the fire insurance business but rejoined the Winnipeg Electric Railway in 1900 in the accounting department.

Mr. J. S. Mackenzie, former purchasing agent of the Winnipeg Electric Railway Co., has been appointed treasurer to succeed Mr. Henson. Mr. Mackenzie has had sixteen years service with the firm. He was formerly with the Toronto Railway Company but went to Winnipeg in 1902 when he joined the staff of the Winnipeg General Power Co. When that firm was absorbed in 1906 by the Winnipeg Railway he went with the latter company as purchasing agent, a post he has occupied since that time.

Opening Meeting of The Electric Club of Toronto

The opening meeting of The Electric Club of Toronto will be held on September 20. Arrangements have been made whereby the Club will meet in the Prince George, as formerly. The first Friday's proceedings will be of unusual interest, for Mr. Kenneth J. Dunstan, president of the Club, has consented to address the members on certain phases of his trip to England and France during the present summer. Mr. Dunstan's mission to the Old Land was primarily in connection with Red Cross work, but he saw many other things and members may look for a rare treat.

An Evening's Experience in France

Our readers will be glad to hear of the safety of Mr. M. B. Hastings, secretary, A. H. Winter-Joyner, Ltd., who, it will be remembered left Canada with the 4th Canadian Mounted Rifles Battalion, B.E.F. He since has been transferred to an artillery company and in a recent letter to Mr. Joyner describes a typical evening's experience. The following extracts are of keen interest—from a letter dated July 31:

"You gave me your trials and temptations so I'll give you a brief review of one of my evenings about three nights ago. That day I was playing h—— with the Hun's outposts, knocking them in and causing his angry passions to rise. Sud-

Lieut. Hastings is second from the left in upper row

denly, Crash! Bang! and he tried to knock my gun out. He threw everything but 8 inch shells and up. After about twenty minutes he stopped, so just for fun I gave him five for luck and had the crew beat it for safety. It was funny the antics the Hun went through trying to locate my gun. It was still there when I left to come out for a few days' rest.

"I got to our headquarters behind the line a short distance where we lived in a tin hut, very well concealed by a hedge. It was purely a condition of concealment vs. protection. It worked fine until the Hun apparently noticed too much movement and decided to investigate. He had been shelling very close to us, (within a hundred yards,) for over a week and we hoped he would stay there.

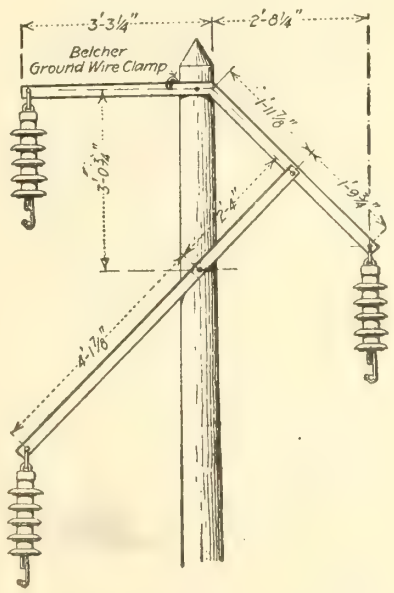
"When I got back I was told the Hun seemed to be searching and was putting shrapnel very close. We were used to that, having had our roof punctured on different occasions. On my birthday I picked up the ragged piece of a shell without getting out of bed.

"Well, I ate dinner while the other two played cards. After dinner I read the paper. Swish bang! Three times. I think I'll get out and see what it's all about, says I. The next one burst right above us and the nose-cap (about a two pound piece), went through the chair I was sitting on and through the floor six feet into the ground. Everybody moved because he was putting them over in salvos. I ran for a dug-out and just got there when my sergeant got hit and knocked out. I ran back and pulled him in. I don't know how I escaped as two others were hit, but not serious. Just as I got the sergeant to the mouth of the dug-out a shell burst right at the mouth and the concussion blew us down the hole together. The blaze almost blinded us also. We were safe then, so I proceeded to dress the sergeant's wound.

"After the strafe was over we got an ambulance and got the sergeant to the A. D. S. where he was off to the rear in less than half an hour.

"As we were there a man came running in to tell us a shell had burst amongst a group of men and horses. The three officers of our battery, (including myself), decided to get busy. We got to the place and found a horrible mess of men and horses. The three of us got six men to the A.D. S. and got their wounds dressed. We then came home and decided to sleep out in a hole. When I went to my sleeping bag I found seven bullets in it.

"We slept like tops, the O. C. and I in the same hole. The next morning I looked at my trench coat and it was all stained with blood from the poor chaps. We then looked over our former home and I counted seventy-two holes in the roof. I dug out the nose-cap and kept the bullets which were in my bed and they are now on the way to———.



"We moved our headquarters."

Under date August 9, when the Allied offensive was well under way, Mr. Hastings again writes: "This is probably the first letter you have received which was actually written on a battlefield while the action was in progress. I can't tell you more at present. The boys have again covered themselves with glory and we are a proud lot. It takes more than Huns to stop the boys with such jump in them and such a high morale."

And on August 12, "Fighting is very hard—we have advanced 20 km. I am well but very tired."

Steel Cross-Arm of Easy Construction

A simplified modification of the wishbone cross-arm worked out by the engineering staff of H. M. Byllesby & Company for use on Southwestern properties is described in a recent issue of the Electrical World. Its construction is very simple. It consists of two pieces of 2.5-in. by 2.5-in. by 5-16-in. angle iron held together by a single bolt. The upper

piece contains only one bend and the lower member is straight. The pieces, which together weigh 65 lb., are held together by a ⅝-in. bolt 1.5 in. long. The arm is bored for two ⅝-in. through bolts, for three 0.75-in. insulator "C-hooks" and for a 9-16-in. Belcher ground wire clamp. The arm shown is made for 66,000 volts. It has been used by the Oklahoma Gas & Electric Company, and in this lightly loaded district it has given general satisfaction. It is light in weight, is easy to manufacture and assemble, on account of having so few bends, and affords ample clearances.

The Dealer and Contractor

Arguments to Combat the Average Customer's Objections to Wiring His Home, Installing More Outlets, Buying More Appliances —Sell Convenience, Economy, Utility

In support of the Convenience Outlet Campaign, being carried on during the month of September, the Society for Electrical Development have prepared a number of business-getting arguments and methods designed to meet the objections of the average householder. These arguments would be equally effective, however, in any contractor-dealer's campaign and we print them herewith believing they will assist materially in any drive for more business.

Every prospect you approach will advance some objections to offset your solicitation of wiring business and orders for appliances. Many, if not all, of those objections can be anticipated. And in every instance plans for dissolving such objections may be formulated in advance and held ready for use when needed.

Some of those plans may be found by test to require modification or additions to make them properly effective. But even so, a plan, regardless of its weaknesses, is infinitely better than no plan at all. So accept these plans to start with. Improve upon them as you go along.

Remember: While you sell wire, outlets, experience, labor and appliances, your customer buys economy, utility, convenience and satisfaction of this, that or the other particular need. Keep that thought in mind as you study these arguments. Observe the principle in your actual selling practice. Here follows an outline of the most to be expected objections, together with the suggestions for dissolving them.

The Prospect Who Says: "Too Expensive"

Don't make the mistake of arguing against that declaration because that will not help you at all. They doubtless are honest in their belief, due to their having a clearer understanding of the cost of the improvement than of the benefits made possible thereby.

Handle the problem rather from this angle by saying something like this: "Viewed from your standpoint, I don't blame you for feeling that the job's too expensive. But that's because you are too easily pleased. You don't expect enough for your money. So, naturally the job appears too costly. But just let me show you what you actually get for your money." Then show them.

The Prospect Who Says: "My time is not so valuable"

Don't combat that statement—accept it. Say something that will convey the thought suggested by the following: "Well, the busiest women I know are those who always have time for everything. They actually do so much that they don't realize how very valuable their time is. So I guess I know what you mean. But here's a point upon which I know we are agreed: Anything that saves steps and labor and protects your good health is worth its weight in gold to you, isn't it?" (Ninety-nine times out of one hundred, the answer will be "Yes").

Then show how more outlets, by making possible a greater use of appliances, will save labor, and make possible the saving of fuel, food, money. Stress the patriotic necessity for such economies.

The Prospect Who Says: "Installing Outlets (or more Outlets) means that we then will have to buy more appliances"

Naturally, of course, you cannot reply to that statement until you know what appliances are in use to-day. So find out what appliances the prospect has. Then, if you can show wherein and how more outlets would make for the better use of those appliances, do so.

Then explain how much money progressive housewives put into electrical appliances last year, because of the added economy, convenience and utility their use affords. Then lead the prospect to say that she expects some day to have a complete equipment of electrical appliances also. That will be your cue to urge the advisability of having the necessary outlets installed at once, as the first step towards enjoying the benefits of those new appliances she has declared it to be here intention to buy.

The Prospect Who Says: "We only rent"

Find out, if possible, the duration of the lease and the terms regarding improvement and upkeep. If there is assurance of possession for a reasonably long period, you probably will be able to show that the proposed investment for wiring and outlets really boils down to an expenditure of only a few cents daily. Classify that trivial expenditure with the price of a daily paper. Then show how many economies, advantages and comforts that piffling daily expenditure makes possible. Show that the value will be derived from the investment many times over before the lease expires and that going away and leaving the wiring and outlets as a fixture of the house can be done without any feeling of loss.

The Landlord Who Says: "My houses are always rented. Why should I go to the expense of installing Outlets?"

There's a lot that can be said in reply to that argument, but don't make the mistake of committing yourself to a particular line of attack until you know the facts. For instance, how frequently do tenants leave? How much of the gross rental income goes to pay fees to rental agents for securing new tenants? How many such vacatings are due to just such inconveniences as those occasioned through lack of outlets? Would not the saving in fees to rental agents, and, also the added rental income secured through keeping the houses rented continuously or more nearly so, seem to offset many times the investment for wiring and outlets?

On the other hand, if his houses actually are rented all or nearly all of the time, the argument should be to show (1) the added convenience to tenants, and the consequent enhancement of property value; (2) keeping the equipment of the house on a par with that of the many other

rented houses that do have all such conveniences; (3) the greater ease with which property can be rented; (4) the opportunity to ask a greater rental income. Also, there is the opportunity to appeal to the owner's pride in his property, his desire to keep his houses on a par with the best, etc.

The Woman Who Says: "I don't want to have my house and routine deranged"

Agree with her at once—she's perfectly correct; no woman appreciates such annoyances as she probably has in mind. Then make the point that wiring and installing outlets is not a messy operation, that the work can be completed with hardly more confusion than attends, say, putting a new battery on the electric bell. Explain just how the work is done. Assure her that the work can be done while she is out shopping or visiting and that you will make yourself responsible for all that occurs in her absence.

The Woman Who Says: "No,—I think its dangerous to have those Outlets around where the children can get at them"

Go easy here; the woman has the safety of her children in mind, and you cannot afford to dismiss her scruples by pooh-poohing them. Show her rather how extremely improbable and difficult it would be for children who are too young to observe instructions about leaving things alone, to contrive so as to receive any hurt. Show her that the construction of outlets is such that it would require considerable ingenuity even on your part to manipulate things so as to receive any hurt.

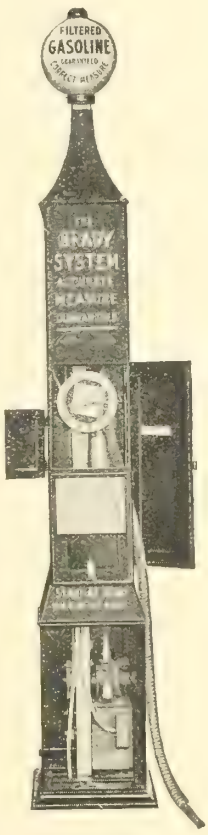
Then commence your talk about the advantages of having plenty of outlets. Tell her of the many houses you have wired for outlets. Make a point of emphasizing how pleased such households were because of the opportunity thus provided to make better use of their electrical appliances.

The Prospect Who Says: "Yes, I wish we had more outlets but we don't wish to spend the money just now. Later we expect to have such work done"

If you are convinced that they lack funds, or if you feel that you might have difficulty getting your money—save time, loss and trouble for yourself by passing them up.

Otherwise, work on the assumption that they are not sufficiently sold on the need for outlets, or more outlets, as may be. Say something like this: "Of course, you know your own business best, but did you ever consider that it probably is costing you more not to have those outlets installed, than it would to have the job done? Remind them of Emerson's statement that "if people need a thing they pay for that thing whether they buy it or not." Show the saving in fuel, food, time, money, labor that would be made possible through the installation of outlets and the proper use of electrical appliances. Then explain the easy payment terms you are offering. Offer to look the job over and tell them just what ought to be done, in your expert opinion.

The Prospect Who Says: "Yes, our house is electric-lighted, but we have no appliances; so we do not need any outlets installed"



Don't, whatever you do, make the mistake of condemning that confessed lack of appliances. That would be fatal to your hopes. Handle the matter rather from the angle suggested by the following: "Is that so! I met a family yesterday who were doing without the convenience and economy of electrical appliances too. But when I explained to the lady just what it was costing her in unnecessary steps and labor, loss of time and actual money-loss, she decided that she could not afford longer to do without the use of outlets and appliances."

Then find out whether they use coal or gas for cooking, and how many there are in the family. That will give you the proper basis for explaining the use of electrical table appliances and an iron. If you cannot succeed in prompting them to decide to start in with such appliances and to have outlets installed accordingly, then try them on the electric cleaner and the washer. They will be almost certain to indicate a pronounced preference for some of the appliances you have mentioned; and as soon as you discover what one that is concentrate your canvass upon the advisability of having an outlet or more installed for the use of that appliance.

If you can get an order to go ahead, don't say anything then about putting in more outlets. Wait until you are on the job. Then explain (at that time) how advantageous it would be to have more outlets installed then and there while you have your tools and are on the premises.

Motor Driven Visible Measure Gasoline Dispenser.

The incidental losses in the vending of gasoline are claimed to be eliminated by the use of a visible measure gasoline dispenser. The accompanying illustration shows the general appearance of the apparatus opened up to show the mechanism. The pump is driven by a Westinghouse ½-horsepower motor, entirely enclosed in the base in accordance with the rules of the National Board of Underwriters. The dispenser visibly delivers a full gallon for every gallon ordered. When the wagon delivers gasoline to the garage, the tank gauge shows accurately the full quantity obtained. Every gallon drawn from the tank into the dispenser is shown on the tank register, which can be checked with the tank gauge. Thus, both the public and the garage owner are protected from loss. Furthermore, the oil companies are enabled to make more rapid deliveries than by measuring cans from wagon to garage tank where this dispenser is installed.

Condensers, pumps, cooling towers, etc. is the name of Bulletin 112-A just published by the Wheeler Condenser & Engineering Co., Carteret, New Jersey.

National Association Merchandising Committee's Report*

The committee's report is particularly intended to help the many contractors who are trying to decide whether it is to their interest to go into the merchandising of electric service appliances. The problems are many and the committee has analyzed the subject carefully with a view of assisting our members in coming to the proper decision.

The committee would recommend that if one or more of the following conditions exist that the wiring contractor should not at the present moment consider going into the merchandising of electric service appliances.

If the wiring contractor's organization is at present kept busy with wiring installations.

If the contractor lacks capital,

If he has not a proper location for a merchandising store.

If he cannot himself give sufficient time to get the merchandising store started in good shape before turning it over to an employee.

Or, if the local lighting company is not on a fair merchandising basis. The local lighting company's policy on lamps and electric service appliances should be thoroughly analyzed.

It is the committee's recommendation, however, to the wiring contractor, if he decides not to go into the merchandising to be sure and get back of every local merchandising campaign, because of the fact that he is bound to get more wiring business on account of the installation of electric service outlets, which means larger feeders, more circuits and, besides, the electric service outlets in the home, office and factory. There is no reason why the wiring contractor, after making an installation, should not also supply the electric service appliances, even if he has no show room, because he must undoubtedly have the confidence of his customers by the time the building is wired, and if he has faith in his own ability as a salesman and the material he is selling he can certainly get the customer's order for the electric service appliances, and with the proper demonstration give the customer the benefit of his experience in the electric business while making a fair profit for himself on the sale.

In urging upon our members the value of the merchandising of electric service appliances, it is not intended that this should include the intensive sale of electrical wiring supplies without their installation, or in other words, compete with the present jobber on sales of supplies to the consuming public, who themselves make the installation. This, in the opinion of the committee would be a grave mistake and would make conditions worse instead of better for the contractor. It would be far better to support the local jobber, who, in consideration of doing a larger wholesale business with the contractor, would not be so keen for the retail business, which they are getting from the consumer as industrial business, but which under any name has, and is to-day, demoralizing the electrical construction business and to a great extent preventing the closer co-operation of contractors and jobbers. It should be the aim of the contractor-dealer to merchandise the wiring supplies installed. There is no doubt that this will make for more complete electrical installations, which again help the sale of electric service appliances which means better electric service to the public.

For those wiring contractors who are contemplating getting into the merchandising of electric service appliances, we have the following suggestions and hope our members will give careful analysis to each suggestion before concluding to take up merchandising.

Market.

Our members should first analyze the potential market in their town or city, or if they are located in the residential neighborhood retail district, the question of the business that they can get from such a neighborhood.

Here we might say that we have it from the best authority that there is less than one appliance to every residential connection, and that there should be not less than $150 f electric service to every residential connection.

We recommend that our members first write to the Society for Electrical Development, 29 West Thirty-ninth Street, New York City, and ask them for their pamphlet, "Three Thousand Uses for Electricity," and also ask the Society of what value it could be to them in the electrical merchandising business. Also subscribe to the electriacl trade papers which are making a specialty of boosting electrical merchandising.

The committee advises also to take up the advisability of going into the electrical merchandising business, with the sales manager of the local lighting company. It is the opinion of your committee that the lighting company would, and should, co-operate in every way in backing up the electrical contractor-dealer in the town or city to the end of making a more thorough application of electric service in the home, office, or factory, because, in the opinion of the committee the use of electric service makes business not only for the central station, but for every branch of the industry, including both the wiring contractor and the dealer.

Location.

As to the location there is no argument but that the more central the location the better, in the retail district of the town or city, or the residential neighborhood retail district. A small store in the heart of the retail district may make more money for our member than the large store out of the retail district.

Capital.

Our members should appreciate that it requires capital to establish a merchandising store, and the most careful analysis should be given to the question of sufficient capital for the equipment of the smallest or the largest electrical merchandising store. Here the committee can only suggest to go slow and careful with the greatest anaylsis before coming to any decision. It is not good business to rob the wiring contracting business to get the necessary capital to go into the merchandising business. There, however, is no reason why a contractor with small capital with a nice, clean store room, with his wiring supplies nicely arranged on shelving, and his merchandising stock on exhibit in a nice, clean show window, and with either himself or a person in charge who can explain the electric service appliances to the prospective customer should not make a success of merchandising. A dealer of this kind may make a much better start than if he goes into too great expense to start with.

Equipment.

Next to a good location the proper arrangement of the entrance and show window is of vital importance, and again,

*Read before the Cleveland Convention by Fred B. Adam, chairman.

the proper layout and equipment of store fixtures. The committee suggests that both the wall cases and the counter cases should be so arranged that they can be extended or increased in number as the business justifies.

It is good business to have the staple appliances in the rear of the store. Consideration must be given to the large samples, like washing machines and ironing machines, that are shown to the best advantage when not too much crowded.

Here we wish to impress upon all of our members the value of keeping their store clean, including the floors, store fixtures, samples and by all means do not overlook the show window. Again, do not allow the wiremen or helpers to use the merchandising store as a proper place to accumulate the supplies for their jobs, or to loaf around while waiting to be placed on the next job. Remember that the majority of your customers for electric service merchandise will be the lady of the house, who will appreciate to the fullest extent the best service you can give.

Publicity.

Publicity is the life of any business, and our member must, in analyzing his capital requirements, set aside a certain amount of money for publicity. However, as to how the publicity should be arrived at is entirely a local problem, and must be worked out in each locality, whether it be a town, city or neighborhood residential retail district. The committee would suggest in a town or city, newspaper advertising, or if in a residential neighborhood keeping the store open nights with an attractive show window, as well as letters to the residences of the neighborhood, and if possible house to house solicitation.

Method of Doing Business.

Your committee recommends that our members send to the McGraw-Hill Publishing Company, Tenth Avenue and Thirty-sixth Street, New York City, for their book on "How to Sell Electrical Labor Saving Appliances," and to the Society for Electrical Development, 29 West 34th St., New York City, and ask for their pamphlet on "How to Sell an Idea," also to very carefully analyze all electrical merchandising methods by visiting the department and other merchandising stores, and never overlook any opportunity of visiting merchandising stores in other cities and towns, particularly the central station show rooms. Your business methods have a vital interest in the success of the business.

The problem of credit sales must be thoroughly analyzed by members. Credit should be given with the greatest care. There is no doubt it makes for greater business, but it also can break the contractor-dealer quicker than any other venture we known of. The committee therefore always recommends if possible a cash sale, unless customer is positively known to be good credit. It is a good plan to join the local credit association, or in a residential district see the other storekeepers.

Credit should never be given for over thirty days, in fact, good business calls for not over thirty days' credit with a trade acceptance, as advocated by the Federal Bank Board.

The committee acknowledges a problem in the question of deferred or time payment terms for the high cost appliances. There is no doubt that time payment terms greatly assist in the introduction of the high-cost appliances, but at the same time makes an unbearable burden to our members with small capital. The committee, however, suggests that in considering the time payment terms our members should analyze the following: The regular selling price, plus 10 per cent to pay for the extra cost on deferred payment accounts, and that no article be considered on time payment terms of less than, according to conditions, $5.00, and if possible $25.00, and that the first payment down should be not less than 10 per cent, if possible 20 per cent, with all other payments not less than 10 to 20 per cent. We also suggest that our members get acquainted with the local methods in handling deferred or time-payment business.

Delivery.

Our members should carefully analyze the necessity and cost for delivery system, and consider that in these war days it is both right and proper to keep the delivery cost as low as possible. Good service to-day does not necessarily call for unnecessary delivery cost.

Demonstration.

Your committee urges upon you to give a careful analysis to the value of demonstrating every appliance in the most careful and complete manner. We suggest that our members make a personal investigation by taking home and trying out themselves the various appliances. It has been said time and again that a sale is not complete until the customer is satisfied and has paid the bill, and your committee is satisfied that the more carefully the appliances are demonstrated the earlier will be a satisfactory condition in electrical merchandising. Here we wish to suggest to the wiring contractor that it is not good business on his part to take an order, for an example a washing machine, and have the jobber's salesman do the demonstrating. We have heard of several instances where such demonstration made a heap of trouble to the wiring contractor and caused him to never try and make a sale again. He should make the demonstration himself and he will know the trick of making the next sale.

Records.

Your committee suggests that you write to J. E. Sweeney, chairman of our Committee on Credit and Accounting, for suggestions on keeping the accounts of the wiring business and merchandising separate, also how to keep records of the various classifications of sales for electric service appliances, for example a separate account of lamp sales, household irons and small appliances, cooking utensils, vacuum cleaners and washing machines. Such records will greatly assist our members, as well as your committee, in investigating the cost of overhead for each classification of merchandising.

It is also suggested that records be kept of all sales in the above classifications on the question of current consumption basis, which is of value to your committee as well as the central station.

Competition.

If our members start out with the idea "that he profits most who serves best" the question of competition will not be such a serious one, particularly if they would analyze the common remark of a prospective purchaser that they can purchase a certain article at so and so for less money. This is the most vicious and barbarous kind of competition, and in a great majority of cases when run down to a final decision is found to be only the customer's desire to purchase at a cheaper price. The committee would suggest that the best quality of merchandise has the least competition, and if regularly sold at the manufacturer's selling price is more staple than if left to the judgment of the particular dealer who is making the sale. This does not, however, mean that only one price articles should be considered. It is a known fact that first quality articles are made by several manufacturers, who differ in the price, which is always an advantage to the dealer in advertising as well as selling to the customer. However, we believe that close co-operation between Association members and the central stations will eliminate the bugbear of competition to the greatest extent.

Co-operation if less talked about and more applied, we

believe would spell success for the electrical appliance merchandiser in the shortest possible time, and your committee urges upon you that this co-operation is positively necessary in the electrical industry, and must include all branches of the industry as included in the various conditions of each locality. It must include the closest co-operation between the contractor dealer, jobber and central station, and if possible the manufacturers, or representatives of manufacturers.

Your committee suggests a Co-operative Committee, consisting of one or two representatives, of each of the above branches of the industry be formed to take charge of the local merchandising campaign and that this Co-operative Committee be continued as long as the necessity continues in the locality.

Data and Sales Book Pages.

Your committee hopes in a very short time to co-operate with the Committee on Data and Sales Book to the end of furnishing our members with all kinds of information on electrical appliance merchandising on pages for the Data and Sales Book.

Costs and Accounting for the Contractor*

Much stress has been, and properly should be, laid upon the fact that accounting is a real fundamental of all successful business. With this in mind your Executive Committee determined that the subject should be developed and that an educational movement should be fostered that had as its object the eventual adoption of a standard classification of accounts for electrical contractors and dealers, and possibly the recommendation of a complete bookkeeping system that would meet the needs of some of our members. You can readily appreciate that it would be impossible to submit a complete bookkeeping system that would meet with approval or adapt itself to the peculiarities of all our members' business. We do anticipate that we can design and submit a simple and accurate system of forms and instructions that will meet the requirements of the average electrical contractor.

The average electrical contractor when asked how he keeps track of the cost of his contracts and the cost of conducting his business appears rather surprised that so simple a question should be asked of him, yet, when confronted with specific items and details admits that he has no special system or method. One of the objects of the standard classification of accounts which we are submitting is to get all contractors, large and small, to designate these specific items and details in the same manner and by the same account name. Then we will be able to collect and disseminate information for comparative purposes that will have a tangible value to everyone in the industry.

In order that this work might be brought to the favorable attention of the various branches of the electrical industry, your Executive Committee authorized my conferring with the several branches of the industry and I am glad to give you the results of that conference, to date.

At a joint committee meeting held in Chicago we agreed upon the following capital accounts:

CURRENT ASSETS—
- Cash in Bank .
- Petty cash fund.
- Certified check Account.
- Accounts Receivable.
- Trade Acceptance Account.

Inventory Account.
- Wiring Supplies.
- Fixtures and Glassware.
- Appliances.

Fixed Investments.
- Furniture and Fixtures.
- Tools.
- Automobiles—Trucks.
- Building.
- Real Estate.

Prepaid Values.
- Insurance.
- Deferred charges to income.

LIABILITIES—
- Capital Account.
- Capital Stock.

Current Liabilities.
- Accounts Payable.
- Notes Payable.
- Trade Acceptances.
- Accrued Taxes.
- Accrued Interest.

Reserve Accounts.
- Reserve for Loss on Notes and Accounts Receivable.
- Reserve for Depreciation on Furniture and Fixtures.
- Reserve for Depreciation on Autos and Trucks.
- Reserve for Depreciation on Tools.

CURRENT PROFIT AND LOSS ACCOUNT.

SURPLUS ACCOUNT.

In addition to these capital accounts we also agreed on the following designation of expense items:
- Salaries—Management.
- Salaries—Sales.
- Salaries—Office.
- Salaries—Shop.
- Commission and Bonus Account.
- Rent, Heat and Water.
- Light and Power.
- Telephone and Telegraph.
- Fire Insurance.
- Liability and Compensation Insurance.
- Advertising.
- Taxes.
- Interest on borrowed capital.

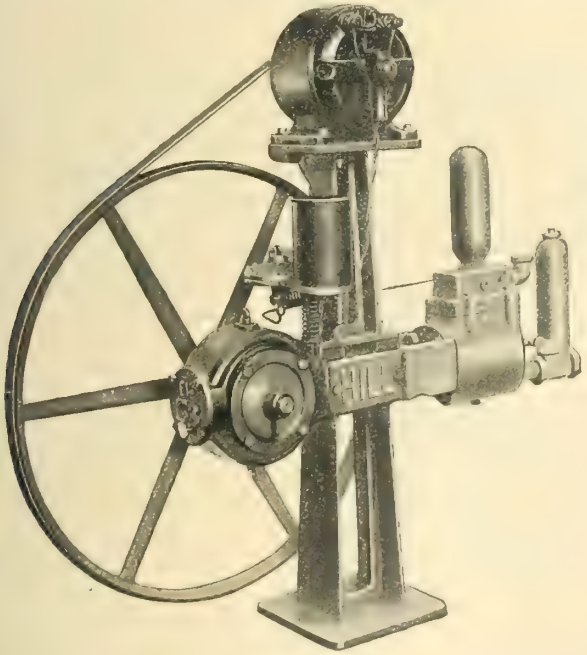
Clear and concise definition and description and all that pertains to the above-mentioned accounts is now being formulated and shortly, I hope, will be transmitted to you through the means of our Data Book. This information will also be supplemented by various articles in electrical trade papers.

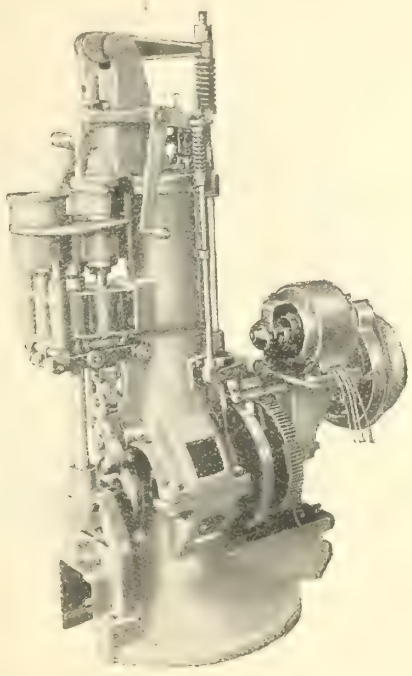


*Report presented at the Cleveland Convention by the Chairman, Mr. J. E. Sweeney.

Tuesday Evening, October 15th

Contractor-dealers, jobbers and manufacturers are specially interested in hearing Mr. W. L. Goodwin on Tuesday evening, October 15. It is expected that several hundred electrical men from all over the province will be present at the dinner at the King Edward Hotel, Toronto, on that occasion, when Mr. Goodwin will explain his plan of co-ordinating the various elements in the electrical industry to the end that "more electricity may be used in more ways by more people." Keep the date in reserve—Tuesday evening, October 15. Every electrical man is not only welcome but urged to be present. Hon. Frederic Nicholls will preside.

Automatic Electric House Pumps



The accompanying illustration shows an automatic electric house pump for pneumatic service. The pump is compactly arranged so that it occupies little floor space and can be mounted on a sub-base adjacent to the tank or at a distance as desired. The pump is of the horizontal double-acting type, claimed to be the most successful for drawing water by suction and forcing a continuous stream against pressure. The cylinder is brass fitted with ample water passages, valve area and air chamber. Crank and cross heads work in an oil bath in an oil tight case. A Westinghouse motor is mount-

ed on the top of the pedestal, as shown, where it is away from dampness, oil, or floor dirt and convenient for starting and stopping the motor which maintains the water pressure in the system above a fixed value. The motor is connected directly to the electric light circuit in the house. The pump forces water into the pneumatic tank compressing air therein, as required. The expansion of the air drives water through the house pipes to the kitchen, laundry, bath, etc., in a steady continuous stream. When the pressure in the tank reaches the desired maximum, the motor and pump automatically stop until the water is drawn off enough to reduce the pressure to a predetermined setting of the switch. To prevent the tank from becoming water logged, an air valve is provided, which, when opened, allows air to be forced into the tank with the water.

Piston Vacuum Machine

This piston vacuum machine, used by canners and preservers, combines a tumbler sealing machine and a vacuum pump in one simple unit, requiring only a ¾ horsepower Westinghouse motor to operate it. It is claimed that an ordinary operator can seal as many as fifty tumblers a minute with this machine, with less effort than formerly, because of the construction, which enables him to perform the work of unloading and loading one pocket while the machine removes

the air from the other pocket, and seals it. The degree of vacuum desired in each package can be regulated instantly. Broken tumblers are reduced to a minimum, since the sealing strain is applied through compensating springs which seal each jar alike, although one may be larger than the other. The variation is taken up in the spring. Changes from one size to another can be made easily in two or three minutes. The machine is made in two types, for sealing tumblers, from 2½ to 6 inches in height, by the Anchor Cap and Closure Corporation, Brooklyn, N.Y. The two-pocket type is used for dry or pastry products, and the four-pocket type for liquid or semi-liquid products which are apt to spill or splash. Either type is arranged to give three speeds, as desired.

Model Laundry in new London Hydro Show Ro

Current News and Notes

Meaford, Ont.

Mr. David Robinson, electrician for the Georgian Bay Milling and Power Company, Meaford, Ont., met death recently by electrocution.

Montreal, Que.

July figures for the Montreal Light, Heat and Power Company just to hand, show gross earnings for the first quarter of the fiscal year amounting to $2,567,039, representing an increase of $267,161 over the corresponding period last year.

The gross earnings of the Southern Canada Power Company for July amounted to $41,265 and the net, $18,491, an increase of $7,037 and $4,318 over the corresponding month in 1917.

Orillia, Ont.

Owing to low water in the Severn River the Orillia Water, Light and Power Commission have been forced to curtail power supply in some quarters and also cut off the domestic current at times.

Perth, Ont.

A twelve-year-old boy was instantly killed when he touched a fallen electric wire in Perth, Ont.

Peterboro, Ont.

Petitions are being prepared and will be presented to the Hydro-electric Commission in the near future requesting extensions to the street railway in Peterboro, Ont.

Rainy River, Ont.

A by-law authorizing the town council of Rainy River, Ont., to purchase the plant and equipment of the Rainy River Electric Light and Power Company, has been carried by the ratepayers.

Regina, Sask.

An increase of 22 per cent. is reported in the passenger traffic on the Regina municipal railway over he corresponding month of last year. The total number of passengers carried was 446,000 and the receipts were $21,400.

An increase of approximately 15 per cent. in wages, and other concessions, has been asked by the electrical workers in the Regina municipal power house and street railway department.

Saskatoon, Sask.

The Lemery-Denison Electric Limited, Saskatoon, Sask., have been incorporated.

Sherbrooke, Que.

Donohue and Audet, electricians, Sherbrooke, Que., have registered.

Toronto, Ont.

Statistics covering the operation of the Toronto Civic Railway during August show an increase of 229,993 in passengers carried and $5,094 in revenue, over the corresponding month in 1917. The month's revenue was $28,731 and the number of passengers 1,719,364.

The electrical workers in Toronto, according to the International Union of Electrical Workers, very much desire a licensing board so as to promote a very high general proficiency among the members of their trade. The idea is to have the government appoint a licensing board comprising five members; one from the Hydro-electric Power Commission and two each from the Electrical Workers' Union and the Electrical Contractors' Association.

Trail, B.C.

The West Kootenay Light and Power Company are taking immediate steps toward the construction of a hundred mile transmission line from Greenwood to Copper mountain, in the Similkameen country, to supply power to the Canada Copper Corporation. The present power line ends at the Greenwood smelter of the Canada Copper Company. The new line will furnish power for the operation of a 2,000 ton mill and mines near Princeton, although it will be some time before the installation is completed.

Vancouver, B.C.

The ratepayers of Vancouver, B.C., will be asked to vote on the 6 cent fare question in the near future.

Winnipeg, Man.

A board of conciliation will be appointed to look into the matters at issue between the employes and the Winnipeg Electric Railway Company. The demand is for wage increases to 47 cents an hour for the first three months; 55 cents for the next nine and 60 after the first year, overtime to be paid time and a half, the present nine-hour day to remain.

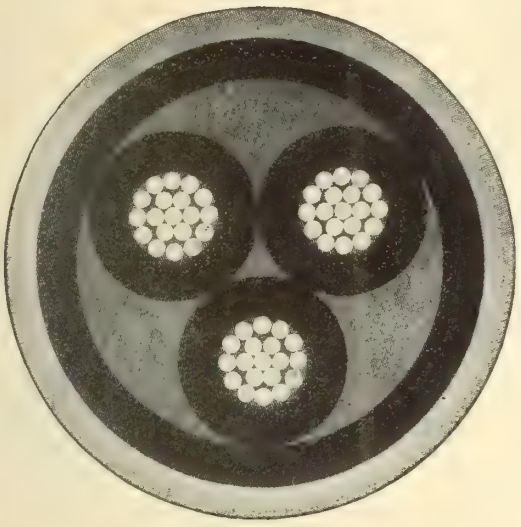
An item in the Winnipeg Free Press states that an automatic telephone system for that city is contemplated.

Windsor, Ont.

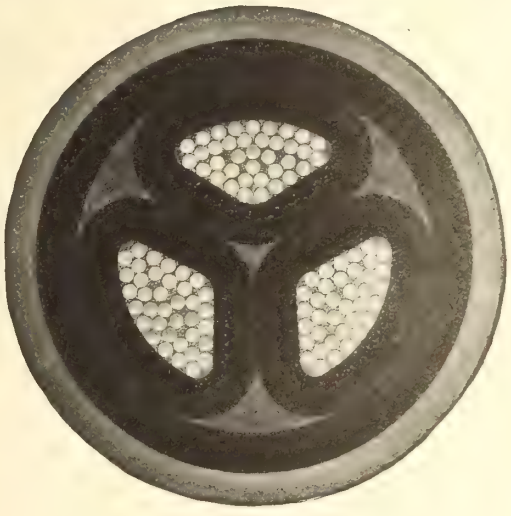
Negotiations are being carried on by the Ontario Hydro-electric Commission with the Windsor, Essex & Lake Shore railway for the purchase of the company's system, which operates between Windsor, Kingsville and Leamington, in addition to serving prosperous rural communities. The price asked by the company is said to be $1,000,000. Mayor Tuson, of Windsor, believes that Kingsville-on-the-Lake can be made the lakeside resort for not only the border communities, but Detroit and other Michigan cities.

Obituary.

The death occurred recently of Mr. Alfred Hanley, manager of the Kingston office of the Great Northwestern Telegraph Company. He was said to have been one of the best telegraphers in the country and had been manager of this office for the last 15 years.



William Henderson, electrical engineer, died recently in Quebec City following an accident whereby he fell into the hold of a ship. Mr. Henderson was in charge of the Government electrical work in connection with shipping at Quebec. He was a native of Scotland and had been in Canada nearly twelve years.



New Book

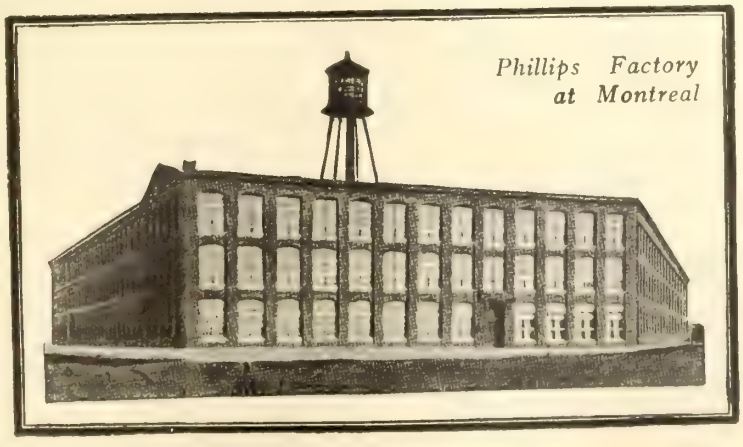
How to Sell Electric Labor-Saving Appliances—compiled by Electrical Merchandising; McGraw-Hill Book Company, Inc., New York, publishers. A compilation of 119 useful plans for the electric store—window displays, show cases, shelves and table arrangements, advertising, prospects, training clerks, planning sales and management. A valuable book for every dealer in electric merchandise as there are tested plans which have proven their value in dollars and cents and, moreover, are for the most part very simple in application. The book is illustrated; size 5 x 7 inches, price $1.00.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in.. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

The Electric Taxicab

By A. Jackson Marshall.

The electric taxicab installations in several American cities continue, after protracted and exacting tests, to give excellent service. Their cost of operation is considerably below that of gasoline taxicabs, and none of this type approach the "electric" in quality, of service, including safety, cleanliness, noiselessness, dependability, absence from obnoxious odors, and ability to negotiate quickly dense traffic encountered in thickly populated urban districts.

Shortly prior to our entrance into the war, plans were maturing rapidly for the inauguration of extensive electric taxicab service, in New York, Philadelphia, and other large cities, the initial installation in New York City to have consisted of five hundred such cabs which were to have been augmented to meet the inevitable demands which were anticipated. When financial conditions will permit, this development will be launched.

Electric taxicabs have been used successfully in several European cities for a number of years, in some of which preferential rates applied in the matters of licenses and taxes as it was realized that electric taxicabs, and their operation, possessed features of advantage to the municipalities.

While several proposed electric taxicab installations in Europe are pending, advices received the middle of June state that owing to the scarcity of petrol (gasoline), a service of electric motor-cabs (taxicabs) is about to be inaugurated at the Hague, Holland, and which may, by this time, be in operation.

In passing it will be of interest to note that in Detroit, the birthplace of the modern, successful electric taxicab, that these electrical conveyances are operated during the day by women who discharge their duties very satisfactorily.

For Sale

100 H.P. Low Speed Induction Motor for 2200 volt, 3 phase, 60 cycle circuit. This is a large machine, having 44 poles and runs 158 R.P.M. on 60 cycle circuit.

The Stator is split, the lower half weighing 15 tons, the upper half 11 tons.

The rotor is 12·3 in. in diameter and weighs about 13 tons.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL
The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"
Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"
Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"
Fire-resisting paint, or colorless solution.

"ARMACELL"
Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"
Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"
for coloring electric lamps. Used in the Royal Navy. Weatherproof. Dries rapidly.

"ARMABRON"
Bitumen protective paint, elastic, acid-resisting, weatherproof.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Ins. 332 pages, illustrated. Price $2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

Electrical Meters, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price $6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

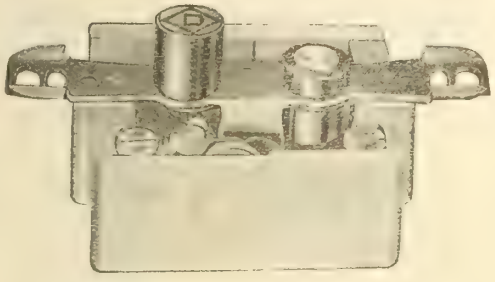
The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.



Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:
"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

SQUARE D
STEEL ENCLOSED SWITCHES

THE ORIGINAL SAFETY SWITCH

Points of Foremost Importance in Choosing Electrical Equipment

—The cost of the equipment and the cost of being *without* it.

The great number of accidents which are constantly occurring in industrial plants which can be prevented by Square D Switches—mishaps to equipment and injury to employees with expensive consequences—all emphasize the fact that it is *expensive* to be *without* Square D Switches.

And although the safety feature of Square D Switches points out an enormous ultimate economy, the initial cost of a complete installation but slightly exceeds that of ordinary knife switches!

Your plant electrician will tell you of the safety, service and above all, the saving of a Square D Installation.

GROWTH—

Day after day, week after week, month after month, for the five years that Economy Fuses have been on the market, the sales have maintained a constant growth—not alone in volume, but also in percentage of increase. This is because

ECONOMY Renewable FUSES

are absolutely accurate in operation and cut annual fuse maintenance costs 80%. An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.
THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

Every Woman Needs Its Help—Now

—but when the fall buying season comes, will you be ready?

Why Not Order a Good Supply of

Northern Electric

Portable Sewing Machines NOW?

Remember the greatest need for sewing by electricity is now, when the women of Canada are so extensively engaged in doing their own as well as a large amount of patriotic sewing work at home.

The Northern Electric Sewing Machine eliminates the tiresome, back-aching treadle work of the old method, and enables the operator to do twice as much sewing without effort.

The Northern Electric Sewing Machines are of the highest grade in design and workmanship, and carry a guarantee of complete satisfaction in every way.

Several different types are obtainable in both portable and stand style machines. You can secure either vibrating shuttle or bobbin type.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

DURABILITY

Type I-14 Watthour Meter

The Egyptians built for permanence. They put the best of their aptitude and facilities into every unit of their structure. Durability was their keynote and we admire them because their works show they lived up to it.

Where centuries ago they dedicated huge monoliths to the gods, the manufacturer of meters **today** dedicates his products to critical humans. Only by the satisfactory operation of these small mechanisms can his work be called a success.

The I-14 Meter is built by men long trained in that work and with facilities developed for that need. The materials used in their construction, too, are the best that can be obtained or manufactured. From back plate to cover the individual parts are built to last and give long service.

The extensive use of this one type of watthour meter by many firms, after submitting the meter to trying conditions, proves that our modern meter builders have imitated the ancients by retaining "Durability" as their watchword.

Where Motor Reliability is Shown at its Best

The maximum refinements of motor manufacture are best demonstrated in the small motors used in the countless portable tools for factory, home, office and store.

Reliable service from these small motors demands workmanship which is accurate to thousandths of an inch, materials which are infallible and designs which are worked out with laboratory precision.

The hundreds of thousands of R & M small motors which are daily giving reliable service in devices of this kind, the dominant place R & M Motor has earned in this branch of the electrical industry, reflect clearly the standards of quality which have been established in the Robbins & Myers organization.

This quality standard is maintained in every R & M Motor, the larger motors for general power service as well as the small motors for portable tools. No other standard is recognized by the R & M factory workman, purchasing agent or engineer.

R & M Motors are made for all commercial circuits in sizes ranging from 1/40 to 30 horsepower inclusive.

ADVERTISEMENTS

Orders for advertising should reach the office of publication not later than the 5th and 20th of the month. Changes in advertisements will be made whenever desired, without cost to the advertiser.

SUBSCRIBERS

The "Electrical News" will be mailed to subscribers in Canada and Great Britain, post free, for $2.00 per annum. United States and foreign, $2.50. Remit by currency, registered letter, or postal order payable to Hugh C. MacLean, Limited.

Subscribers are requested to promptly notify the publishers of failure or delay in delivery of paper.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 27 Toronto, October 1, 1918 No 19

Buy Useful Gifts—Buy Now

After conference with representatives of leading industries and retail interests concerned, the U. S. Council of National Defense reports that the manufacture of goods for the coming holiday season has been substantially completed, that the transportation of the goods to the point of sale is also largely done and urge that Christmas shopping begin at once and be spread evenly over the next three months.

The retail interests represented at the conference have agreed not to increase their working force by reason of the holiday business over the average force employed by them throughout the year, and not to increase the normal working hours of their force during the Christmas season. They also agreed to use their utmost efforts to confine Christmas giving, except for young children, to useful articles and to spread the period for holiday purchases over the months of October, November and December.

The retail interests referred to have further agreed to make announcement to the above effect in their advertisements commencing immediately. The above suggestions if faithfully and loyally put into effect throughout the country will make possible a continuance of the holiday custom without endangering the national interests thereby.

The Council of National Defense will co-operate in carrying out the suggested measures. It looks to organized business bodies of every nature and throughout the country actively to join in the movement as providing means whereby that co-operation between the government and the people can be had which alone will permit continuances of holiday business by such methods as are consistent with the national welfare.

If this idea is good for the United States would it not be equally so for Canada? In the interests of conservation of salespeople, to say nothing of the nervous energy of the public itself, let us make our slogan "Buy useful gifts—buy now."

St. Lawrence Power Co. Secure Privileges with Time Limit

The International Joint Waterways Commission has assumed authority in the matter of the application of the St. Lawrence Power Co., and have granted this company permission to build their weir. The proviso is attached that it must be removed at the end of five years, or if the war should last longer, at the ending of the war.

In granting this permission the joint commission is evidently accepting in good faith the statement of the company that the extension is only required to meet war demands. The proviso attached is merely an evident intention to guard the rights of both countries in the St. Lawrence River. The placing of the time limit, though quite too long, if the war should end as soon as we all hope, leaves the final disposition of the St. Lawrence water powers entirely at the disposal of the governments. The gravest objection to the decision is probably found in the fact that when the St. Lawrence Power Company makes its claim four years hence, as they naturally will do the onus of proof that the weir is adversely affecting the flow of the river rests with Canada. In all fairness the responsibility of proving their point should have devolved on the company that has received the benefit of the doubt during the four year period. The commission's decision reads as follows:

The Order as Granted.

"It is hereby ordered as an interim measure that the construction of the said weir and its maintenance until the expiration of the term of five years from the date hereof, or until the termination of the present war, is hereby approved upon the following conditions:

(1) "That at the expiration of said period of five years, or upon the termination of the present war, whichever shall last occur, said weir shall be removed by the applicant, reserving, however, to the applicant or any other interested party the right to apply to the commission at least one year before the expiration of the said period for a further continuance of the said weir, and on such application the commission may approve of such continuance on such terms and conditions as it may deem appropriate and equitable for the protection of the rights and interests of the people on both sides of the line.

(2) "That the said weir shall be constructed and maintained in accordance with the plans mentioned, and under all the terms and conditions set forth in the permit granted by the Secretary of War dated Sept. 10th, 1917, so far as the same are applicable.

(3) "That for the purupose of protecting the rights, property and interests on either side of the boundary from any injurious effect, resulting from the construction and maintenance of said weir, the commission will, during the term of its approval, herein retain jurisdiction over the subject matter of said application, and may make such further order or orders in the premises as may be necessary.

"Provided that in the foregoing order the commission shall not be deemed to have considered nor passed upon any question pertaining to the rights of the applicant to divert water from the St. Lawrence River."

The expected has happened in the announcement that the Canadian government refuses to acknowledge the right of the

Joint Commission to make a judgment in the matter and will make a protest with the United States government. In the meantime it is said that the power company is going ahead with the work.

Who Sells Electrical Goods?

A trade magazine devoted to the hardware trade quotes "the sales manager of one of the largest electrical firms in the country," to the effect that, "about 78 per cent. of his output is now being handled by dealers in other lines than the regular electrical firms."

We have no means of knowing the particular line of goods referred to, but the statement, if true, is a caustic commentary on the inadequacy of the electrical dealers' organization to cover the field. Such a state of affairs indicates a woeful lack of organization—an almost entire absence of co-operation between the various elements in the electrical trade. There may well be some arguments in favor of such an arrangement, but surely there are many more against it—chief of which seems to be placing the retailing of electrical appliances in the hands of a class of men who know nothing of the virtues of these goods and whose enthusiasm (even if they did know) must at best be evenly distributed over a number of competing lines—gas, coal, wood and coal oil, to say nothing of the many other lines the average hardware man carries.

There is no apparent reason why every town large enough to support two or three hardware stores, should not also be an excellent location for a live, up-to-date contractor-dealer. It should not then be a difficult matter to come to an agreement with the various manufacturers that their products should be handled exclusively through this store. The fact that hardware stores take so readily to electrical goods shows pretty conclusively that they are readily saleable and also profitable. Should the industry as a unit not work for an exclusive electrical store in every town? Would it not in the end mean, "more electricity, used in more ways, by more people?"

Opening of the 1918-19 A. I. E. E. Season

Seventy members and friends attended the meeting at the Engineers' Club on Friday Sept. 20 which opened the 1918-1919 season of the Toronto Section of the A. I. E. E. This is the beginning of the sixteenth year since the formation of the Toronto Section but the keenness of the members has shown no decline with advancing years. Mr. P. M. Lincoln the speaker of the evening is well known in Toronto and his talk on the Development of Electric Power Transmission was full of interest in a city which receives practically all its electric power over a group of high tension lines. For this reason the discussion was particularly active and controversial. Mr. Arthur Hull who presided announced that a further aspect of controversy would be introduced at the next meeting on Oct. 4 when a discussion on the Grounded Neutral on High Tension Systems would take place. It was desired to discuss every possible phase of the subject, the number of points for grounding, value of resistence or reactance and broadly whether under any circumstances an isolated neutral had any advantage. It was also announced that in November an official meeting of the Institute would, be held in Toronto at which the president and directors would attend from New York. Among the members who took part in the discussion were the following: John Murphy; H. C. Don Carlos; F. G. Clark; E. T. J. Brandon; H. U. Hart; D. H. McDougall; H. B. Dwight; E. V. Pannell and A. E. Davison. The secretary is compiling a list of members of the Toronto section on active service and will be glad of any assistance the home members can give him.

Imperial Water Power Board

The conclusions of the special committee of engineers and scientists, recently appointed by the British Government to investigate the power resources of the Empire, that there should be created an Imperial Water Power Board, to include a representative nominated by each of the Dominions overseas, is fraught with such tremendous import to Canada that it is hoped the Government will take prompt and favourable action upon the suggestion. Our own Government has already given evidence of its appreciation of the prime importance of a thorough knowledge of our power resources and the urgent neecssity for their development so that we may be in a position to meet all the needs of the country. This is essential in order that Canada may compete, with success, in the reconstruction period following the war. By the creation of the Dominion Power Board, under the chairmanship of the Honourable Arthur Meighen, the Government has provided a means of concentrating upon this great problem, the experience and judgment of the Dominion and Provincial organizations concerned with the administration and the investigation of water powers. This Board has but recently been constituted but it has already given evidence of its usefulness and should undoubtedly produce results of lasting benefit to the country.

Opening Meeting, Electric Club of Toronto

The opening meeting of The Electric Club of Toronto, held in the Prince George on Friday, September 20, was satisfactory in every way. The large and representative attendance was indicative, no doubt, of the interest the members are determined to take in their club this year, though there is no question but that the program was very largely responsible for numbers that could scarcely have been anticipated so early in the season when many of the members have not yet returned to the city. Mr. K. J. Dunstan, the president of the Club, who was the speaker on this occasion, gave the members a rare treat in a wonderful word-picture of his trip to and from the European Continent this summer and his experiences in England and France. Mr. Dunstan spoke under the disadvantage of having to concentrate the incidents of months into the short space of half an hour, but succeeded to a degree in focusing the attention of his audience on the salient points. Through all their varied programs, the Club has heard nothing more thoroughly delightful or more intensely interesting.

One Man Cars

The St. John Railway Company have made application to the Utilities Commission for authority to operate one-man cars. The application is opposed by the men on the ground that some 28 of their number would be thrown out of employment. In view of the shortage of labor of this class in other cities their argument would almost seem to favor the use of one-man cars. However, it was further held that with the hilly nature of the city, these cars might create an increased hazard to the patrons of the system. Further evidence is being taken.

The Royal Commission appointed to deal with the affairs of the New Brunswick Power Company has issued an interim report which contains an order, effective October 1, granting a temporary increase of rates by the company. After that date car fares will be six cents instead of from four to five; electric light will be 7½ to 15 cents instead of 6 to 12, and power rates will be 2.75c to 12 cents instead of 2 to 10. The commission also recommended the introduction of one-man cars.

Electro-Technical Industry of the World During and After the War

The course of the electrical industry of the world during the war is fully treated by M. Gurewitsch in the Bulletin of the Association of Swiss Electrical Engineers and reported in the Electrical Review. Among the industries, he says which have undergone great development, not only in belligerent but in neutral countries, the electrical industry takes an important place. From the outset of the war, the electrotechnical works in Germany, France, England, and the United States were able to adapt themselves quickly to the manufacture of munitions, and to realize large profits thereby. Let us take, for example that establishment which is in the forefront of the German electrical industry, the Allgememe Electricitats Gesellschaft. According to the last annual report, electrical installations actually under construction had fallen in value from 48,000,000 to 46,600,000 marks. Notwithstanding this, the amount of business transacted was very considerable, which is explained by the extensive orders from the military authorities; the gross profit realized had allowed of the making of large extensions to the works. If a portion of these extensions was principally due to the needs connected with the manufacture of munitions, there remained no inconsiderable portion available for employment after the war, which would thus strengthen the financial position of the company. The net profits realized in 1916-17 were below those of 1912-13 by 2,470,000 marks (30,370,000 against 27,900,000 marks). Other electrical works in Germany, as well as in the other belligerent countries, achieved similar results. But the manufacture of electrical material generally had much increased, as the thousands of works supplying war requirements created an enormous demand for electrical machinery and plant. The rolling mills in America during 1916 made calls for electric motors of a total power of over 200,000 H.P. (among which were units of 6,000 and 10,000 H.P.) while from 1905 to 1916 the yearly increase in the same industry was only between 40,000 and 60,000 H.P. The following table gives (in millions of dollars) an idea of the growth of electric production in the cases of three of the chief American companies:—

	1912.	1914.	1916.
General Electric Co.	90	90	120
Western Electric Co.	73	60	105
Westinghouse Co.	37	32	80

It may be remarked in passing that the first-named company increased its capital in 1917 by $20,000,000.

In the above figures war material is not included. Furthermore, only 7 per cent. of the output was destined for exportation; all the remainder was absorbed by the home market of the States. Nevertheless, as an outcome of the stoppage of German exports (which in 1913 totalled 467,500,000 fr., against 189,000,000 fr. for England and 146,000,000 fr. for the United States) the exports of the American electrical industry considerably increased. Hence the total exports of electrotechnical products rose from $28,200,000 in 1913, $19,960,000 in 1914, and $24,340,000 in 1915, to $40,240,000 in 1916. Thus the exports of 1916 exceeded to the extent of 43 per cent. the already fine figures of 1913.

Not only the American electrotechnical industry but that of Sweden likewise showed excellent results. That country was not only able to supply its own home markets, but also furnished large quantities of electrical products for exportation, especially to Russia. The largest Swedish electrical concern, the Allmanna Svenska Elektriska Aktiebolag at Vasteras (A.S.E.A.) realized in 1916 a net profit of 12,400,000 kr., against 4,600,000 and 2,200,000 kr. in the two foregoing years. This company has increased in capital from 26,000,000 to 33,000,000 kr., and acquired a number of works—the Nya Forenade Elektriska A.B., the Evenska Turbin Fabriks A.B., the Lilijeholmens Kabelfabrik, etc. Besides this, it has set up a foundry and a porcelain insulator works. This increase of the company's export business is shown in the following table (in millions of kroner):—

	1912.	1914.	1916.
Home market	13.9	20.6	39.4
Exports	3.8	6.2	10.9

Exports for 1916 were thus threefold those of 1912. The branch companies of the A.S.E.A. in Denmark, England, and Russia also did good business. During the war the company's position was so strengthened that it no longer had any fear of foreign competition in Sweden. For example, while imports of electrical machinery from Switzerland in 1913 were 316,000 fr., and in 1914 694,000 fr., the figures in 1915 and 1916 fell to 57,000 and 101,000 fr., respectively.

The English industry was too much occupied with war supplies to pay attention to the normal market. English exports consequently fell off, as the table below shows (in thousands of pounds sterling):—

	1913.	1915.	1916.
Exports of electrical machinery	2,275	1,391	1,552
Other electrical goods	5,405	3,169	4,107
	7,680	4,560	5,659

In consequence of the enormous demands and the difficulties of manufacture, even for the home market, imports of electrotechnical products into England showed only a small reduction, namely:—

	1913.	1915.	1916.
Electrical machinery	1,345	1,522	1,088
Other electrical goods	1,587	1,096	1,653
	2,932	2,618	2,736

The most important supplier to England was the United States. Switzerland supplied machinery principally, exports rising from 1,234,000 fr. in 1913 to 2,014,000 and 1,798,000 fr. in the two following years. On the other hand, Swiss exports fell in 1916 to 642,000 fr., and in the first nine months of 1917 to 452,000 fr. It must be remarked that the manufacture of electrical machinery in England before the war was fairly well developed, machinery figuring as 30 per cent. of the total electrical exports. It must be believed therefore, that after the war electrical construction works, enlarged and strengthened by supplying the military requirements, will be in a position to satisfy all the wants of the Empire. The manufacture of electrical machinery has, indeed, attained such a development in England that the Government, on November 16th, 1917, forbade imports as unnecessary. (Besides, Swiss industry in the matter of machinery, can hardly struggle against that of England, as the former is 10 per cent, dearer.)

On the other hand, Swiss exports of measuring appliances to England greatly increased during the first three years

of the war, as the figures below show (in thousands of marks):—

	1913	1914	1915	1916.	Jan.–Sept. 1917.
Control and measuring appliances	181	332	387	402	89
Various	118	307	473	297	176
	299	639	860	699	265

The prospects of the exportation of installation material into England should, in general be favorable, for English manufacture of this material was very little developed before the war, insomuch that Germany exported to England in 1913 goods of this kind to the value of 9,752,000 marks. In reality, however, English works at the present moment are in a position to meet home wants, and to such a degree that the Government has, for example, forbidden the importation of meters.

France had greatly reduced its imports of electrotechnical products; these had fallen from 37,500,000 fr. in 1913 to 24,100,000 fr. in 1914, and to 24,400,000 fr. in 1915. But as since then the military calls for electrochemical and electrometallurgical products have enormously increased, a very intense constructive movement in the domain of hydraulics has begun. In consequence, French imports of electrical plant in 1916 rose to a value of 61,300,000 fr., sub-divided as follows:—

	Fr.
Electrical machines	15,100,000
Apparatus and measuring instruments	15,400,000
Cable and leads	14,000,000
Armatures and machine parts	7,500,000
Various apparatus	9,300,000

French exports fell from 37,200,000 fr. in 1913 to 28,000,000 fr. and 26,300,000 fr. in the two following years; on the other hand, they rose in 1916 to 46,300,000 fr. This rise is chiefly explained by the large exports of electrodes, which varied as follows:—

	Fr.
1913	8,560,000
1914	6,320,000
1915	12,090,000
1916	25,760,000

From the point of view of quantity the export of electrodes in 1916 was only 10 per cent. more than in 1913, but the value was trebled. In the case of Switzerland, French exports of electrodes sank to a third in the same period: 765,000 fr. in 1913 and 244,000 fr. in 1916. We said previously that France imported electrical machines to the extent of 15,100,000 fr. A little less than half of these imports came from Switzerland, which exported machines to France in 1916 to the value of 6,900,000 fr. (30 per cent. of the total exports). In 1917 (January to September) exports to France reached the figure of 4,800,000 fr., whereas for the whole of 1913 the figures were only 4,170,000 fr. The considerable augmentation in the figures of Swiss exports of electrical machines to France is not explained merely by the increase in the price, but also by the larger quantity—namely, 16,432 machines in 1913, against 22,822 in 1916. In 1914 and 1915 exports fell to 3,000,000 and 3,500,000 fr. respectively. Swiss exports to France of "sundry apparatus" likewise increased after suffering a decline in 1914 and 1915. Thus the total rose from 1,461,000 fr. in 1913 to 1,975,000 fr. in 1916, and to 1,666,000 fr. in 1917 (January to September only). In the same period exports of Swiss glow lamps to France rose from 323,000 fr. to 1,269,000 fr., and in 1917 to 712,000 fr. for the first nine months only. Exports of batteries from Switzerland likewise advanced from 33,000 fr. in 1913 to 664,000 fr. in 1916; while, on the other hand, control apparatus and measuring instruments suffered a fall from 634,000 fr. to 348,000 fr. As a matter of fact, the manufacture of measuring apparatus is highly developed in France—to such a pitch that in 1913 that country was able to export these articles to the value of 14,600,000 fr. In 1914 and 1915 these exports fell to 9,100,000 fr. and 6,800,000 fr. respectively, rising, however, in 1916 to 12,100,000 fr.

The author believes that in the future France will be compelled to import electrotechnical goods, particularly when it is remembered that, according to American estimates, an expenditure of 500,000,000 fr. on these articles will be needed in the work of reconstitution of the invaded provinces. According to the statistics of the president of the Syndicat des Industries Electriques, the yearly output in France of electrical goods before the war reached the total of 221,000,000 fr., which amount is subdivided as under:—

	Fr.
Dynamos, transformers, and electric cranes	66,000,000
Electric apparatus and lamps	67,000,000
Cables and leads	40,000,000
Telegraph and telephone apparatus	26,000,000
Sundry appliances	22,000,000

According to other estimates, the French output would be 300,000,000 fr. (against an output of 1,550,000 fr. in Germany in 1913, and 1,900,000 fr. in America in 1914), of which 100,000,000 fr. stand for electric machines and transformers, and 60,000,000 fr. for cables and leads. In any case, the French industry cannot suffice for itself. As regards Switzerland more particularly, the situation will be very favorable in view of the difficulty which Germany will meet with in the resumption of trade, her exports to France totalling, before the war, 18,000,000 fr. Switzerland will, however, have to reckon seriously with English and American competition.

Italy is unable, any more than France, to supply her growing requirements of electrotechnical products, and the more so, because her industry is less developed. Even in pre-war days she was obliged to have recourse to foreign industries (particularly those of Germany); in 1913, for example, Italy imported to the extent of 32,000,000 lire. Italian exports were unimportant and only amounted to 10,300,000 lire. Three-fourths of the exports were made up of cables shipped, for the most part to South America. After the entry of Italy into the war, Switzerland occupied the position of Germany as the supplier of Italy. Swiss exports to Italy were as under (in thousands of francs):—

	1913.	1914.	1915.	1916.	(Jan.–Sept.) 1917.
Electric machines	934	1,158	1,089	873	677
Control apparatus and measuring instruments	355	276	373	959	949
Telegraph and teelphone apparatus	14	17	84	1,055	603
Glow lamps	276	252	1,420	2,689	3,113
Sundry appliances	489	507	245	579	395
	2,060	2,219	3,211	6,055	5,737

As in all other belligerent countries, electrotechnical works in Russia have done good business, and dividends have been much greater than in peace times. Almost all the works have doubled their capital. The Russo-German A.E.G. Co., whose dividend for 1916 was 10 per cent., has been reconstituted, after its liquidation on July 1st, 1917, under the style of the General Electric Co. (A.E.K.), with a capital of 24 million roubles, one third of whose shares have been acquired by the Russian Government. According to the latest reports, this company (in which the American General Electric Co. has interest to the extent of 4,000,000 rubles) has raised its capital to 36,000,000 roubles. The Russian Siemens-Schuckert Works and the A. G. Siemens & Halske (whose dividends in 1916 were 7.5 and 12.5 per cent. respectively) have likewise

been liquidated, and towards the end of 1917 were to be transformed into a new Siemens company with a capital of 25,000,000 roubles, in which the Russian State would take a share.

The third Russian electric company—the Dynamo—in which the English and American Westinghouse companies take a considerable share, doubled its capital in 1917, raising it from 10,000,000 to 20,000,000 roubles. Similarly the Basins of the Donetz Electricity Co., founded in 1916, proposed to build extensive electricity works near the Donetz coal fields, and by utilizing the anthracite deposits there furnish Southern Russia with cheap electricity. The company has secured authority to raise its capital from 7 to 14 million roubles. Other new companies are:—The Donetz Electric Power Co., 5,000,000 roubles; Electrification of Grosny-Naphtha District Co., 4,000,000 roubles; and South Russia Electric Installations Co., 30,000,0000 roubles. The two related companies—the Petrograd Electric Lighting Co. and the Baku Electric Power Co.—have also increased their capital from 9 to 13 million roubles. Its internal disorganization has hindered Russia from undertaking the utilization of its many waterfalls, although in 1917, 32,000,000 roubles were allocated to deal with the fall on the River Walchow. As an outcome of the coal deadlock, many new electric railway schemes have been planned, such as the Crimea railway, that of Trans-Caucasia, and the Kars line. All these schemes are hung up owing to the internal state of Russia.

Japan electrical industry has undergone an enormous expansion during the war. So recently as 1913, Japan was obliged, on account of the undeveloped state of her own industry to draw upon oversea countries, principally Germany and England. German exports of merchandise to Japan in 1913 were to the extent of 15,000,000 marks; electric machines, about 45,000,000; cables, 3,000,000; high-tension apparatus, 1,700,000; measuring instruments, 660,000 marks, etc. England exported to Japan in the same year to the value of £286,000 (electrical machines, £188,000). Japan's total imports in 1912 reached 35,000,000 yen, 50 per cent. from Germany and 30 per cent. from England.

Since the war the position has completely changed, and Japan's electrical industry has not only been able to supply its own home wants, but also to intervene in the markets of the world. Before the war, that country's output of electrical machines was between 30,000,000 and 35,000,000 yen; in 1916 a value of 85,000,000 yen. This brilliant showing is owing, first, to huge war exports; and, in the second place, and chiefly, to her possession of ample copper resources available at small cost. This advantage which the Japanese industry enjoys over that of the European industry will subsist aftetr the conclusion of peace, for, on account of the dearth of tonnage, European countries, and especially Germany, will be able to import copper only with the utmost difficulty. Thus in the Far East the European electrical industry can hardly hope to compete with that of Japan.

The Swiss electrical industry has suffered much from the war; this is especially so as regards the wholesale industry. The manufacture of electrical products has had to struggle against enormous difficulties—such as the want of raw materials and labor, and the difficulties of transport. These last have completely paralysed exportation to certain countries, notably to Russia. The influence of the war on Swiss exports of electrotechnical products is clearly shown by the following table:—

Swiss Exports in Thousands of Francs.

	1913.	1914	1915.	1916.	(Jan.-Sept.) 1917.
Electrical machines ..	20,353	15,578	15,245	22,631	16,618
Control apparatus and measuring instruments	2,307	2,037	2,904	4,304	2,6..
Glow lamps	850	577	2,369	4,691	4,465
Accumulators	115	85	818	1,131	390
Telegraph and telephone apparatus	150	107	144	1,120	615
Cables and leads	1,403	974	451	510	428
Lamp carbons	143	184	562	478	151
Sundry apparatus	4,996	5,740	2,960	5,878	5,033
	30,357	23,283	25,454	40,742	30,307

It should be noted that if the total of exports is larger for 1916 than for 1913, the number of machines exported is less. One thing that must be said is that the retail industry has grown at the expense of the wholesale. In 1916 one-half of Switzerland's exports of accumulators and batteries went to France; likewise, the whole of the glow exports, which had practically quadrupled, went to France and Italy. Of the Central Powers, Germany held first place as recipient, more especially of electrical machines, owing to their abnormal dearth there, due to that country's inability to furnish itself with copper.

Lastily, the Dutch market has undergone considerable development since the war, as has also that of Spain. The wants of the latter country will be still larger after the war, for the growth of the Spanish industry has been very rapid.

A few words in conclusion as to the future of the electrical industry of the world. We said above that the Americans, who were much interested in the reconstitution of the invaded countries have estimated the requirements of France in the matter of electrotechnical products at 500,000,000 fr. They estimated, furthermore, those of Belgium at 250,000,000 fr. On these bases the reconstitution of all the invaded lands would demand fully 1,000,000,000 fr. Nothing short of this will be needed to occupy the electrical industry of the world for many years to come. On the other hand, the normal calls for electrical products will greatly increase after the war. The general lack of coal, which will continue long after the war, will everywhere lead to the utilization to a greater extent than formerly of water-power, etc. Furthermore, the scarcity of foodstuffs, cotton, etc., will give a new spurt to the realization of irrigation schemes in Italy, Russia, Asia, and other countries, and all such schemes imply huge hydro-electric installations. In lands lacking great water resources, small installations will have to be superseded by big generating stations erected near coal mines. Finally, the fact must not be lost sight of that the extensive electrochemical and electrometallurgical establishments which have grown up during the war will need after the war an enormous amount of electrical energy. Moreover, the call for electric power in all industries will be enlarged to an extraordinary degree after the war; for electricity tends daily to become the basis of industry in all its branches. Its more rational production, enabling energy to be supplied at a much lower rate, will raise it from the position of a mere accessory to that of the very essence of all industrial production.

Long Distance Wireless

A new high-power radio station has just been opened at Annapolis, Md., capable of maintaining uninterrupted communication over a distance of at least 4,000 miles. There are four steel towers, each 650 feet high, supporting the antennae which, with the ground system, required 160 miles of wire for their completion. The power supply installation is in duplicate so that in the event of one plant failing it will always be possible to maintain communication. The operation of the station requires the services of 100 men and suitable provision has been made for protection. The plant was erected in 10 months and cost $1,500,000.

Modern Practical Methods of Accident Prevention in Small Companies

By Mr. Wills Maclachlan*

Possibly the reason for assigning to me this subject is because I asked for a solution of it at the New York Convention. Accident prevention in the small utility or in the large utility, transmitting energy hundreds of miles with only a small operating force at any substation, is entirely different from that of a company where the calling of a meeting of one hundred or five thousand employees, is possible. In one, you are dealing with a few employees at one time in a more or less personal way, in the other you are dealing with a number and the psychology of the crowd is brought to bear. I have by no means a complete solution to offer, because I had no precedent to follow. I have been forced to use for the most part the "cut and dry" method and have had to a great extent to use my own judgment as to the particular method that would work out best in the individual case.

No matter what method is used, there is one axiom that should hang over the desk of anyone in charge of accident prevention work. —"Don't bluff". If you are in earnest and mean exactly what you say and act as if you meant it, men will follow you and you will have their support. If you are trying to put something over under the guise of accident prevention, they will see it before you have finally decided upon the details yourself. You will have done yourself and your men an injury and delayed the real work of accident prevention. Remember that you are working to save money for the company, and to safeguard the service to your consumers, as well as to preserve the limbs and lives of your men, for themselves, their wives and families and for their country and its Allies. Tell your men this and lay your cards on the table and gain their respect and support.

One of the difficulties of interest to the small company in accident prevention is the fact that accidents do not occur frequently in the same plant. This is quite true, but accidents or lost time per capita in the small plant is as large, if not larger, than in the large plant and the hazard is just as great. Also in utility work the accidents are not numerous but they are severe. I think that I am safe in saying, that if the manager of the small plant will sit down and make out a list of accidents and lost time, due to accidents, over a period of a few years, he will fully realize his duty as far as the work of preventing accidents is concerned, just as much as will the manager of a concern employing thousands. His is the legal responsibility of financial economy to the company, his also is the moral responsibility to his men and their families.

Must Be Handled by An Expert

To successfully handle any work in a company, it must be put in the hands of someone who is an expert in the particular line. In the large company, accident prevention is the whole duty of one man or a staff. This is not possible in the small company, but there is nothing to prevent a number of small companies banding themselves together into an association for the purpose of accident prevention and employing someone to supervise the work for them. This has been done successfully and to the advantage of all concerned, the companies gaining the benefits of the wider experience of the supervisor than if he were engaged by but one company.

Another plan that has worked out very successfully is to engage on retainer a supervisor who will give a certain portion of his time towards the work of the company. This supervisor may be one man or may be a firm or bureau.

In regard to the carrying on of accident prevention in a public utility, I feel that it should be in the hands of an engineer who has had experience in design, construction, operation and management. I realize that this is usually a large order, but you are playing for the lives of men. I fully realize that many in this work are not engineers, but you will usually find that they have the advice of engineers, and if you can combine the qualities in one man, I feel that you are in a stronger position. I also lay emphasis on the experience; this, I feel, is important. He will have to work with all departments and must be in a position to deal intelligently with their details. When you meet the line foreman—know the right way to put on his belt and spurs and know the details of line work and you have him with you.

In starting the work in a utility, I would say the first thing to do is to go over the accident record for as many years as is possible and tabulate this under "Cause and Department" for accidents and lost time due to accidents getting it on a per capita basis if possible.

Next comes the physical examination of the plant. Let us assume a hydraulic development under moderate head with a transmission line and substations. The intake should receive our first consideration. Is the dam safe? Should it be guarded to protect employees or the public? Is the stop-log winch O.K. or should the gears be protected and should men be warned in regard to danger from winch handle if the chain is down during moving of winch? Then the racks need attention. A very good plan is to put a 4 x 6 along the edge of the platform just over the racks. This gives the men a good foothold in icy weather. If men are working over fast-moving water, they should have life lines, and at least life buoys and pike poles should be handy.

Protection in the Power House

Next let us go into the power house, taking up first the turbine equipment. The belts driving the governors and oil pump, if any, should be guarded by a wire mesh guard. The fly balls and small gears on governor should also be guarded. Then if the turbines are driven by crown gears these should be enclosed. Safe access to all bearings should be assured. Guard rails should be put around the generators and any exposed leads guarded. I mean here, guarded and not insulated. Next the switching equipment. Are there disconnecting switches between the oil switches and the busbars and between the oil switches and outgoing feeders? This is important for maintenance work. Can all fuses on motor transformers be easily got at? Switches should be plainly and distinctly named, preferably front and back of the board. Rows of disconnecting switches should have distinguishing mark between different switches and the name of the switch in such a position that when the operator reaches with his switch stick for the switch, he will see the name. If disconnecting switches are at all cramped, baffles of asbestos board or equivalent should be between blades. In the lightning arrestors, there should be disconnecting switches between them and line, and barriers between different banks of arrestors. If the tanks are not grounded, they should be

* Before Congress of National Safety Council, St. Louis.

screened and screen grounded. One rather important point is to guard the operator in throwing a disconnecting switch, from stepping back into live apparatus.

An important point in design but rather hard to put in force in a finished plant is to arrange two means of exit from behind all switchboards, switch galleries and from all switch cell structures. This is to give the operator a chance in case of a short circuit.

The next point is the miscellaneous equipment. All belts and gears should be substantially guarded, the stairway should be safe and passageways all lighted. Tools should be examined and all burred sledges, drills, etc., dressed. Rubber gloves should then be examined inside and out and usually condemned. Our practice is to use buckskin covers over rubber gloves. This is for mechanical protection.

In telephone arrangements in systems using high tention the operators and patrol man must be protected. This can be very well taken care of by use of the insulated stool or cabinet. Also by training operators in the correct way to use the receiver to guard against deafness from severe noise.

In arranging the lighting attention should be paid to the safe renewal of lamps and fuses. Many designers seem to forget this and place lamps and fuses dangerously near high tention apparatus.

The Transmission Line.

We will now go over the transmission lines with the patrolmen. Is there a provision for grounding the line just outside the power house? This should either take the form of grounding switches, grounding clamp or a ground chain. The patrolmen should carry either two sets of grounding clamps or two ground chains. Personally I have grave doubts as to the effectiveness of ground chains, but on some systems of patrol grounding clamps are too heavy to carry. Now, let us look at the switching tower. If it is supplied with a platform, the platform should be railed and a toe-board provided. Some systems are now putting in switching towers with switches operated by a chain or rod mechanism; this should be grounded and provision made for locking in both the open and closed positions, both of which should be clearly designated. The switch of course having its name or number clearly shown.

Coming now to the substation, we will check up the grounding provision, disconnecting switches, etc., as in the power house. It might also be well to try to get into the substation without using the key to make certain that all windows, doors, etc., are locked. If the substation has an attendant and if in the summer season, doors have to be left open for ventilating purposes, they should be supplied with wire doors that are locked. One hazard in substations that is often overlooked, is the necessity of using a step-ladder to read transformer temperatures. One way of eliminating this hazard is to make up a periscope by the use of two good mirrors and a length of fibre conduit.

In substations having no regular attendant more care should be paid to protection of apparatus than in attended stations. This is because an unskilled person is often required to go into these stations at intervals to change motor paper or to do simple switching.

In the foregoing, I have just touched the high spots of physical examination of the plant. If it is a steam plant, the same general scheme can be carried out, particular attention being paid to tools in the boiler room. Another point that should be noticed could well be called "good housekeeping". A clean, well organized plant usually makes for the elimination of accidents.

First Aid Outfits.

Every utility no matter of what size should be well equipped with simple first aid outfits. For the utility in a position to call a doctor within a reasonable time, such first aid kit should be very simple; it might contain boracic acid tablets, ginger tablets, carron oil aromatic spirits of ammonia, iodine (Either in the bottle or preferably in ampoul form) castor oil for the eye, some gauze bandages, some triangular bandages, plain or boracic gauze and absorbent cotton. For cleanliness the packages should be small in size or arranged that a small quantity can be removed without soiling the rest. This outfit should be in a compact case and should be regularly inspected. Very simple instruction as to how to use each part of the outfit should be prepared, also instruction as to how to handle a cut, bruise, hemmorhage, or the more usual injuries. This set of instructions should also contain in a very brief way the more important points of resuscitation. If these instructions are prepared in inexpensive form a copy should be given to every employee and a copy kept in the first aid kit. In general as far as first aid is concerned, make the kit simple and have the instructions as simple as possible so as not to confuse the average employee and not to give the men an idea that he is an amateur doctor. My own instructions have always been, that the best kind of first aid is given by a competent doctor and any time wasted in putting on fancy bandages is almost criminal.

Reference was made above to the question of rubber gloves. Arrangements should be made for the regular inspection and testing of rubber gloves. I do not want to take up your time here with the details, but they may be found in the report of the Accident Prevention Committee of the N. E. L. A. Provision also should be made for the inspection and maintenance of linemen's belts and spurs. I do not think that any harm would come of making a regular practice of monthly warning linemen to use their safety belts. Most of us know of cases where a lineman has received a slight shock which has been enough to unsteady him on the pole and in falling he has broken his neck. Committees are working on the correct design of linemen's belt and it is hoped that a recommendation will soon be made public. I am recommending to linemen at the present time that they shall not use hand-axes; they claim however, that it is difficult to get a hammer of sufficient weight to do the work correctly. This however, I feel is a detail that can easily be worked out. The danger of a falling hand-axe should be done away with if at all possible.

Keep Tools Properly Dressed.

The question of inspection of and dressing of sledges, drilling bars, etc., was touched upon briefly before. This is extremely important as a burr from a sledge or drilling bar is very liable to cause the loss of an eye. A regular day should be appointed for going over these two. While on this subject it is naturally suggested that the use of goggles be enforced. Their use has, on countless occasions, saved an eye and they should be supplied and their use enforced as rigorously as possible. It is also desirable to supply goggles that will protect the eyes from an electric flash. These should be non-inflammable and non-conducting and should be as clear as is possible to have them with due regard to being opaque to ultra-violet rays. This can be done without using the dense glasses used in electric welding. Men should be obliged to wear these glasses in doing any work that might occasion a bad flash, such as changing of fuses, working close to a commutator or pulling a disconnecting switch with a short stick.

Fire fighting apparatus should be supplied and rigorously inspected. Fire pails should be protected from being used as spitoons. I have found a very desirable method of doing this by pasting manilla paper over the tops of the fire pails. In using tetre-chloride fire extinguishers, men should be warned against the danger of chlorine gas in confined places.

As far as the physical plant is concerned, ample provision

should be made to allow sufficient space to operate the plant safely, tools and other pieces of apparatus should be regularly and systematically inspected and repaired when necessary. If these two general points are carried out a great number of our accidents will be prevented.

Having now covered the physical plant, our most important consideration should be the obtaining the interest of and training of the employees. First and foremost in any public utility, is the training of every employee in the prone pressure method of resuscitation. This can well be carried out as follows:

Resuscitation Instruction

A few of the employees can be got together and with one as a patient a demonstration of the method given explaining each point in detail. The men to whom this has been demonstrated should then be paired off and told to try to carry out the resuscitation that has been shown them. Most of them will have their hands in the wrong place and will carry out the resuscitation too quickly. They should then be required to practice resuscitation weekly for about two months and then once every two weeks as a part of their regular duties. Records of these practices, together with the names of the men, should be kept with the regular records of the company. After the men have been practicing for sometime, they should be taught to take their hands off the patient's back when they swing back on their knees. A good plan also is to have one man fall as if he had received a shock and curl into any position he wants to, the operator should then see how fast he can get him into position and give him the first stroke. This should be done easily in 8 seconds or less. I have trained some hundreds of employees in this way and they have resuscitated men receiving shocks up to 60,000 volts.

Even in small company, it is quite possible to have meetings of the men. These can be informal talks and if a blackboard is provided a great deal of good information can be given to the employees if the manager or superintendent will enter into the work. As a basis of these talks or meetings, some correspondence course as provided by the N. E. L. A. or various correspondence schools is useful, but a frank discussion of the various features of the plant together with new ideas that are coming out in the technical press from time to time, will be of considerable interest to the employee. In along with this talk on general matters, instruction in and discussion of accident prevention measures can well be taken up. Another important point that should be discussed is the grounding of and taking grounds off the line or apparatus. The putting a piece of apparatus or line into service or taking it out of service and the routine of changing shift. If the company has operating rules, these can well be discussed as it is my experience that in a number of cases operating rules are not understood by the employees and are therefore not lived up to. If there are no operating rules, the National Electrical Safety Code, Part IV. of the Bureau of Standards could be taken up and discussed. Where informal meetings of this type are held regularly it has been my experience that the men will show far more interest in their work, develop into more skilled workers, and be more receptive to information along accident prevention lines. At these meetings, the men should be encouraged to put forward suggestions for the prevention of accidents and if found at all good the company should put them into effect, showing that they are heart and soul with the men in their attempt to prevent accidents.

Bulletins as prepared by the National Safety Council and by other organizations can be used judiciously. Those pertaining to the work of the public utilities being very acceptable to the men and creating considerable interest. These should be shown on a regular bulletin board and not too many put up at one time. The bulletin board should have a glass front as some budding artist among the employees might make very disastrous additions to the bulletin.

To get the support of men in accident prevention work, it has been my experience that it is useless to go ahead until you have the whole-hearted support of the foremen and others in charge of the work. I would far rather take months to win the support of a foreman than to try to carry out accident prevention work with his men without his support. There is another type of man that should be won over, that is, the old employee who thinks that this work is a lot of bosh. In some instances I have taken almost unlimited time to try to find out what was the basis of his trouble and to correct that if possible. An ample stock of stories of accidents with the resulting pain and suffering to the man and his family often is very useful in winning over this type of man. These stories should be told to the man personally in a private conversation and it is just as well not to argue with him before a number of his fellow-workmen.

This plan of work for the small plant can easily be extended to the larger plant and I have found it very satisfactory to use committees a plant having about 600 employees. These committees meet monthly and are started off with the foremen; they receive the suggestions of their fellow-employees, discuss them and pass them on to the executive heads for action. In this particular case there has been a reduction this year as against last year of 41 per cent. of the lost time due to accidents.

Let me make an appeal to the small plant owner and to the larger company having men spread over a wide territory to take up this matter of accident prevention in a serious and earnest way. Your country and mine are engaged in a prosecution of a desperate world struggle. We need every man possible at the Front and this naturally depletes those who operate in our power plants to supply the necessary energy for the manufacture of munitions of war and their transportation. Every day lost by a skilled employee delays or at least interferes with the successful prosecution of the war. It is your duty and mine to see that the operating force carry out their work in an efficient manner. This cannot be done when they are surrouided by unguarded serious hazards. It cannot be done as long as they do not realize the best and safest way for the prosecution of their work and it cannot be done until you, your superintendents and foremen will earnestly throw your skilled experience and executive ability into the work of preventing accidents, and training your men. This is not something that would be nice to do if we had time to carry it out, it is not something that need only be looked upon from the sentimental side, it is something that is causing you great needless expense, interfering with the successful and continuous operation of your plant, causing pain and suffering to your employees and their families and interfering with the work of your country and her Allies.

What Delayed the Cars

Knots of people standing on street corners on Thursday afternoon, September 5, about 6 o'clock, were saying to each other, "Where are all the cars?" About that time between 30 and 40 cars were tied up on Granville street bridge, stretching back as far as Davie street on the north, because the draw span was open for 10 minutes from 5.40 to 5.50.

The passengers in the cars must have numbered 1,500; those in the scores of automobiles tied up and the pedestrians must have added 500 more. So 2,000 were directly delayed 10 minutes by the opening of the bridge. Several thousands more were inconvenienced by the cars being thrown off schedule during the next hour.

What was the great vessel which so urgently needed passage through the bridge in the busiest hour of the day? A pile-driver!—B. C. Buzzer.

Economic Proportion of Hydro-Electric and Steam Power

By Mr. Frank G. Baum

It is, of course, well known that steam power is usually less expensive for low load factors than hydroelectric power, and the latter becomes economical only when the load factor is favorable. To determine the economical division between the two there are usually given curves of cost varying with load factor. Such curves show that at certain load factors the cost of steam power exceeds the cost of water power, but the actual yearly cost of power for any assumed proportion between water power and steam power must be calculated for each case. This becomes laborious.

The results can, however, be shown in a much more illuminating way if presented as shown in Fig. 1. In this figure, abscissae from left to right (from O to O_1) show percentage of total load carried by water power and from right to left (from Oo to o) the absicissae show the percentage of total load carried by steam power. The sum of the steam power and water power must of course equal 100 per cent. for every condition, hence the sum of the two abscissae is 100 per cent. at any point.

If now we take the yearly cost per kilowatt of hydroelectric power as O_1h, taken in the figure at $22 per kilowatt-year, and draw the straight line Oh, this line will represent by any ordinate the yearly charge per kilowatt against the water power for any proportion between steam and water power. For it is clear that if we have one-half water power then the yearly charge per kilowatt against the entire 100 per cent. load is $11. (In comparing the cost of power we must of course include total cost of delivery to center of load.)

Similarly, if we take the yearly fixed cost per kilowatt of steam power as Os, taken in the figure as $11 per kw-year, and draw the line O_1s, this will represent by any ordinate the yearly charge per kilowatt against the steam power for any proportion between steam and water power.

The straight line sh then represents the total fixed charge against the steam and hydroelectric power for any proportion of steam and water power (Oh and O_1s being straight lines and sh being derived by adding the ordinates, gives another straight line).

For example, let total load equal 100,000 kilowatt, divided 70 per cent. hydroelectric and 30 per cent steam; then the yearly charge against the water power and steam will be

Water power, fixed charge	70,000 kw.	× $22	$1,540,000
Steam power, fixed charge	30,000 kw.	× $11	330,000
Total power, fixed charge			1,870,000

or $18.70 per kw-year, as shown by the ordinate of the line sh at 70 per cent water power, 30 per cent steam power. All water power fixed charge would cost $2,200,000 and all steam power fixed charge $1,100,000 per year. All steam power costs $4,400,000.

For any other assumption of cost per year of water power or steam power, it is only necessary to determine the yearly fixed charge against steam power Os and water power Oh and draw the line sh, and we have immediately the total fixed charge for any proportion of water power and steam power. This very much simplifies the problem and visualizes the results.

To determine the total charge per kw-year against the combined steam and water power, it is necessary to add the kw-hr. charge against the steam power. It is of course assumed that all charges against the water power are fixed charges.

To determine the yearly charge against steam power for any load factor we must start with the load curve of the power system. The load curve assumed is that shown on the left of Fig. 2. The ordinates, it will be noted, are plotted in percentage of the load, the peak load being 100 per cent.

Now we must determine the kw-hours carried by steam for any percentage of the total load carried by steam, it being assumed of course that the steam power takes the load off the top of the curve. For this purpose we determine the curve of kilowatt-hours to be carried by steam power when 10 per cent., 20 per cent., etc., of the top of the load curve is carried by steam. To do this we take the area of the load curve above 90 per cent. for example, and determine what percentage this is of the entire area of the load curve. Similarly for areas above 80 per cent., 70 per cent., etc. The results are shown in the curves to the right of the load curve.

For example, if all load over 80 per cent. is carried on steam, we get the steam load factor=17 per cent. and steam

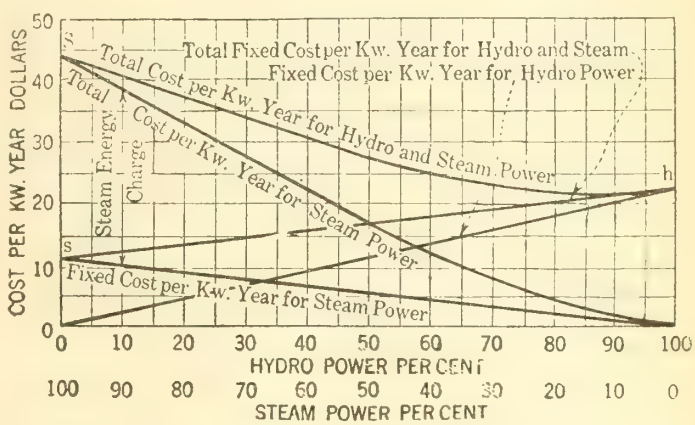

Fig. 1—Proportion of Water to Steam Power
Water power cost per kw.-yr., $22.00
Steam, fixed cost per kw.-yr., $11.00
Steam energy charge per kw.-yr. and 100 per cent. load factor, $44.00

kilowatt-hours 6 per cent. of the total as shown by oa and cd. Also we get a hydroelectric load factor 87 per cent. and kilowatt-hours 94 per cent. of the total as shown by ob and oc.

From the curves in Fig. 2 and the cost per kilowatt-hour of fuel and other strictly steam energy charges, we determine for any percentage of load carried by steam power the yearly energy charge per kilowatt-year. Assuming $33 per kilowatt-year for energy charge where all the energy is supplied by steam for the particular load curve under consideration (which corresponds practically to $44 per kilowatt-year, or 0.5 cent per kilowatt-hour for 100 per cent. load factor, as the load factor of total load is 75 per cent.) and adding the energy charge to the fixed charge for steam power, we obtain the total cost of steam power as shown by the curve "cost steam power" O_1S in Fig. 1.

To obtain now the total cost of all power for any proportion of steam power to water power, we add the ordinates of oh the "fixed cost of hydro-electric power," to the or-

*Before the A. I. E. E.

...ates ... the total cost of the power" and obtain the ... "The total cost per kilowatt year hydroelectric and ... power" This curve starts at $22 per kilowatt-year if ... power is water power By adding some steam power to take off the peaks, we see there is a slight decrease in the yearly charge until the steam power carries about 15 per cent. of load. At 20 per cent. of load the cost again comes to about $22 per year, and then a gradual increase in power cost results.

At 30 per cent. load carried by steam for this particular load curve there is little difference in the yearly charge per kilowatt and we would not for this case be warranted in installing less than 30 per cent. steam; for naturally, unless very material savings result, the decision will always be to install steam power because of the smaller capital cost.

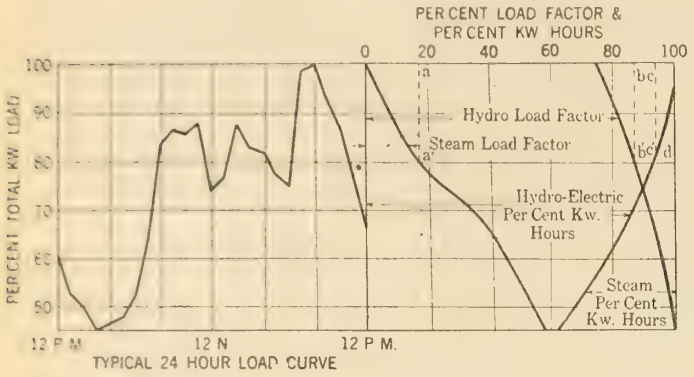

Fig. 2—Load Factors and Kw.-hr. for Steam and Water
Example:
... 20% ... load carried by steam and 80% by water the curves show
Steam load factor = 17% = o a
Water load factor = 87% = o b
Water kw.-hr. = 94% = o c
Steam kw.-hr. = 6% = c d

Note—Steam carries everything above 80% line in example, and the curves will show per cent. load factor and per cent. kw-hours for any other per cent. load taken.

At 50 per cent. of total load taken by steam installation and 50 per cent. by water power, we have the yearly charge as follows:

50 per cent. x $22—$11.00—yearly fixed charge water power
50 per cent. x $11——5.50—yearly fixed charge steam power
Total .....$16.50—yearly fixed charge total power

At 50 per cent. load factor practically 33 1-3 per cent. of the kilowatt-hours are carried by steam and this adds the energy charge of $33 x 33 1-3 per cent. or $11. Therefore the total yearly charge is $16.50 x $11=$27.50, as shown by the curve hS by the ordinate at 50 per cent. The added charge over all water power costs here is $5.50 per kw. year, but on a system with 100,000 kw., the yearly excess charge is $550,000. a very substantial sum.

The curve of total yearly power costs per kilowatt shows graphically what we want to know, and after we have the curve of energy cost of steam power at various load factors, we can very quickly make up total costs per kilowatt-year for any assumption of fixed cost of hydroelectric and steam power. It is believed this method will assist engineers in their work. The actual proportion of steam to hydroelectric power will of course be somewhat influenced by service insurance conditions.

This paper is merely an outline of the general principles and gives the general method to follow. There are, of course, many details and different conditions in different sections of the country. It is hoped that the method presented will appeal to engineers and managers.

The Hydro-electric Commissioners of Peterboro, Ont., have suggested that the city purchase the local street railway system. A meeting of the council will be called to discuss the matter.

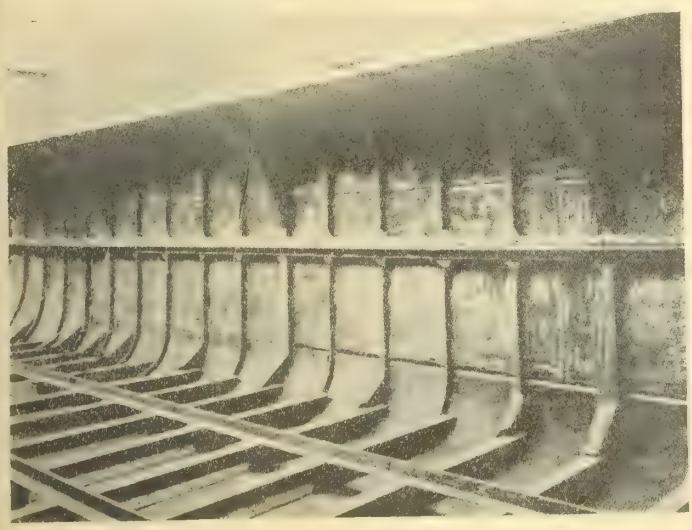
First Electrically Welded Ship Launched

The advent of the electrically welded ship establishes another milestone in the shipbuilding industry responsible for many surprises in its efforts to cope with the situation caused by marine loses. An article recently published in the "Engineer" furnishes us with our first information of authority, and contains comparisons of great interest:—

Electrically-Welded Barge.

Particulars are now available of the interesting—and completely successful—experiment in rivetless shipbuilding, carried out at a yard on the South-East Coast. The first steel vessel constructed entirely without rivets was recently launched in the presence of Lord Pirrie, the Controller-General of Merchant Ship-building and, other representatives of the Admiralty and the war-office. She has since been in service with full cargo during exceptionally rough weather, and has, we understand, passed satisfactory in every way through the severe tests imposed.

The object of the experiment, to which considerable importance was attached by shipbuilding authorities, was to prove the ability of welded construction to withstand the stresses peculiar to a ship at sea. This principle having been established, it is not proposed altogether to dispense with riveting, which in certain sections is cheaper and quicker than welding; it is intended, however, that future vessels should be a combination of riveting and welding. The United States Shipping Board, for instance, having been in close touch with the experimental work, is making arrangements for the construction of a number of 10,000-ton standard ships, in which the use of rivets will be reduced to 2½ per cent. of the number originally required.



The recent progress achieved in electric welding by means of the flux-coated metal electrode process, and its successful use at Admiralty dockyards and elsewhere in the construction of the equipment and superstructures of various vessels, led to premission being obtained for the erection of a standard barge, with riveting eliminated and electric welding substituted throughout. Such a craft, it will be observed, may be exposed to considerable rough usage in dock, besides being subjected to severe towing stresses. Seeing that material already available on the site where she was built was utilized, the barge differs in no way from the standard riveted type with lapped joints, excepting that the hull plates were arranged for clinker build and the plate edges joggled to permit of horizontal downward welding in order to reduce the amount of overhead work, which is more difficult of execution.

The vessel to be welded was 125 ft. between perpendiculars, and 16 ft. beam, with a displacement of 275 tons. The hull was rectangular in section amidships, with only the bilge plates curved. It was built up of seventy-one transverse frames, and contains three bulkheads, those fitted fore and aft being water-tight and that amidships non-water-tight. The shell plating was ¼ in. and 5-16 in. All the joints were lapped in the manner described.

Curiously enough, the first day's work was poor, though all the operators were first-rate men, with extensive experience of electric welding in the shop on minor repairs and on structural work at shipyards. The poorness of the work was probably due to the novelty of the undertaking and to the position—lying flat on the keel—which the men had to adopt to get to the joints. In a few days, however, when they became accustomed to the job, the speed and quality of the work improved so as to become equal that achieved in workshop standard practice. With the more difficult welding, such

as that in the vertical butt joints on each shell plating, and overhead work underneath the keel and on bilge plates it was noted that the quality of the welds was excellent. For this overhead work special electrodes were employed, and proved well worth the slightly increased cost. All water-tight joints up to and including the underside of bilge plates were continuously welded both inside and outside, the other water-tight joints being welded continuously on one side and tack welded on the other. On the shell plating the continuous welding was on joints and frame construction tack welding was adopted, the length of welding being carefully calculated to give a margin of strength over a similar riveted joint. Taking all positions of work into consideration, the average speed was 4 ft. an hour at the commencement, while towards the end of the work an average of 7 ft. an hour was easily obtained.

Some interesting details have been given to us of the comparative cost of an electric welded and a riveted barge.

View showing welded shell plates and transverse frames

In labour, 245 man hours were saved in construction, which can easily be improved on in future work. More than 1000 lb. of metal was saved, owing to the absence of rivets, but it is estimated that greater economy will result when the design is modified to suit electric welded ship construction. The total cost of welding was £301, detailed as under:—

Electrodes	£178
Electric current	61
Men's time	62
	£301

It is realized by the Admiralty experts that the proportion of cost for electrodes is high, but this is mainly due to the present limited demand. Demand and competition will have the usual effect, and should reduce the cost of this item by at least 60 per cent. It will then be possible to build a vessel of this size with an estimated saving of from 25 to 40 per cent. of time and about 10 per cent. of material.

It is interesting to add that, as a result of this demonstration, the yard has prepared a new design of barge, in which it is proposed to incorporate electric welding and riveted construction to the following extent:—

To Be Welded.

Coamings.
Shell seams to frames.
Deck butts to beams.
Bulkheads (including boundary bars.)
Keel plate butts to be welded overlaps.
After shell seams welded

To Be Riveted.

Floor riveted to frames.
Beam knees to frames and beams.
Frames clear to shell seams.

Water Power for the Empire

There has just been issued the preliminary report of the Water Power Committee of the Conjoint Board of Scientific Societies. The Board was appointed by the British authorities some time ago to investigate and report upon various scientific and industrial problems the solution of which was considered vital to the present and future welfare of the Empire. A committee of this board was appointed "to report on what is at present being done to ascertain the amount and distribution of water power in the British Empire."

This Committee under the chairmanship, of the eminent engineer and inventor, Sir Dugald Clerk, is composed of men whose reputation as water power and engineering experts is world-wide and including as it does representatives from Canada and other Dominions, is fully qualified to speak with authority.

The Report states that "To enable the Empire to recover, with any degree of rapidity, from the financial burden imposed by the war, it will be necessary to develop, in a much greater degree than heretofore its latent resources" and adds that "it must be realized that without an ample supply of cheap energy much of this wealth must always remain latent."

It is estimated that the power now being used all over the world is in the neighborhood of 120 million h.p. of which shipping uses 24 million, railways 21 million horsepower, the remainder being used in factories and public utilities. This power is developed roughly as follows, 13 millon horsepower in the United Kingdom, 24 in continental Europe, 29 in the United States, 6 in the British Dominions, while Asia and South America only use 3 million. Of this total amount between 15 and 16 million horsepower is developed hydraulically.

The report proceeds to treat of the Empire water power possibilities, the reasons for the neglect in the past, recent developments including nitrogen fixation, and then gives in such detail as is possible the resources in the British Isles and in other portions of the Empire, dwelling at considerable length on the water power situation in Canada.

The main conclusions drawn from the evidence available by the Committee are:—

1. That the potential water power of the Empire amounts in the aggregate to at least 50 to 70 million horsepower.

2. That much of this is capable of immediate economic development.

3. That except in Canada and New Zealand, and to a less extent in New South Wales and Tasmania, no systematic attempt has as yet been made by any Government Department to ascertain the true possibilities of the hydraulic resources of its territories, or to collect relevant data.

4. That the development of the Empire's natural resources is inseparably connected with that of its water powers.

5. That the development of such enormous possibilities shall not be left to chance, but should be carried out under the guidance of some competent authority.

The report concludes with a number of recommendations which urge the British Government to bring to the attention of the overseas Governments the necessity for a close systematic investigation of all reasonably promising water powers and of their economic possibilities. In event that any government is unable to undertake such work it proposes that a British of Imperial Water Power Board be appointed to control such investigation, such Board, which shall include a representative each from the Dominions, shall also act in an advisory capacity to the Imperial or overseas governments. It also suggests a policy of state-aided water power development.

Get More Heat Out of Your Winter Coal

In view of the universal coal shortage and the consequent wide-spread interest in conserving this commodity wherever and by whatever means possible, we feel justified in printing the following general suggestions on the operation of household heaters, as offered in a recent publication, "Fuel Facts," issued by the U. S. Fuel Administration:

How to get more heat out of your coal than the chimney does, is more important than any other branch of household economy. In the average home 25 per cent. of the coal used can be saved. Most of this saving can be accomplished by proper damper control. Tests have shown that only 40 to 50 per cent., on the average, of the heating value of the coal is usefully employed in heating a house or a building. Under conditions of proper installation and frequent and careful attention, 50 to 60 per cent. of the heating value may be converted into useful heat, while under unfavorable conditions only 25 per cent., or even less, of the heat value of the coal is utilized.

There is no more important general rule than the one emphasized by L. P. Breckinridge, of the Sheffield Scientific School of Yale University, to this effect:

The flow of air through the fuel makes it burn. Learn to control it. Try to visualize this flow of air through the fuel and you will easily learn how to operate the dampers to control it properly . . . The draft of the chimney is much diminished when by opening the check-damper cold air is allowed to flow directly into the chimney.

Save, to Help Win the War.

The Fuel Administration's first charge to the householder is cleanliness. To get the most heat from the least amount of coal his heater must be clean. One one-hundredth inch of soot has the same power to resist heat as ten inches of iron.

The Fuel Administration asks the head of each household to care for his heater himself this winter; to learn how to run his heater intelligently; how to get from every ton of coal every unit of heat it can supply to his family.

Give your heater its first cleaning of the season in the late summer and have it put in thorough repair. Broken parts mean loss of heat. The fire-box should be tight. Trivial cracks may be cemented.

Following are fuel savers and comfort suggestions, assembled briefly in the form of practical rules for operating the various types of household heating systems:

General Rules.

1. Be sure there is a check draft-damper in the smoke-pipe, besides the turn-damper. This check draft-damper is as important in controlling the rate at which the fire burns as is the throttle of an engine. Open it to check the fire. Close it to make the fire burn more rapidly. Experiment with it in the daily regulation of your fire. Make it do its work. The coaling-door was not put on the heater to check the draft. If you cannot check the fire without opening the coaling-door, you need proper dampers.

2. The turn-damper should fit the smoke-pipe loosely and must never be entirely closed. With the average plant it may be kept partly closed most of the time in mild weather, but during severe weather it usually needs to be opened wide.

3. Make use of the lift or slide-damper in the coaling-door only to let oxygen in to consume gases, if you are using soft or bituminous coal after fresh fuel has been added.

4. Just enough draft and that from below, checking the draft by letting more air into the smoke-pipe, is one of the best general rules. This furnishes oxygen from below, necessary for the consumption of the coal-gases, and at the same time gives time for them to be consumed before being drawn up the chimney. This method also avoids escape of coal-gas into the cellar. To make the fire burn more rapidly, do not open the whole ash-pit door, but only the draft-damper in the ash-pit door. Opening the whole ash-pit supplies air to the fire faster than it is needed for combustion. The air is heated, passes out of the chimney and is so much heat wasted.

5. All heat pipes in the cellar should be thoroughly and completely wrapped with asbestos or similar covering to prevent loss of radiation.

6. Grates should be cared for properly. A short, quick stroke of the shaker handle will sift the ashes through the grates. Leave grates in flat position when through shaking. Clean ash-pit daily, to prevent damage to grates. In severe weather grates should be shaken until a glow appears in ash-pit. In moderate weather a bed of ashes should be carried on top of the grates.

7. Avoid poking and slicing fire-bed. It causes draft holes and clinkers.

8. Never shake a fire that is low until you have put on a little fresh coal and given it time to ignite. A thin fire wastes coal. Disturb the fire as little as possible.

9. Storm-windows and storm-doors, weather-strips and such protective devices are economical of heat.

10. Keep the temperature of sitting-rooms at sixty-eight degrees or less. If there are invalids, old folk or very little children in the family, the temperature may be higher. Rooms where you do not sit are more comfortable if much cooler, as a rule, providing the air is kept a little moist. Get a thermometer—a good one. Use it inside, not hanging outdoors.

11. It is wasteful to allow the temperature to drop way down at night. It takes twice as much coal to heat it up again next morning.

12. Turn off the heat in unused rooms whenever possible. Bedrooms should be kept much cooler than living rooms. Don't try to heat all the rooms all the time. If you have a hot-water system, make heavy radiator slip-covers and put them over radiators when not in use. This will prevent freezing.

13. Always keep two pans or open-top jars of fresh water on radiators or in front of registers to keep the air in the home moist.

14. Study the Specific Rules applying to the system of heating in your house.

Hot-Air Furnaces—Specific Rules.

1. Provide cold-air drops from upper floors so as to insure a return circulation from all rooms to the air intake of the furnace.

2. Regulate the window of the cold-air box so as to avoid too great a current of outside air, especially on very cold days.

3. Always keep the water container in the air-jacket filled with clean water. Moist air heats much more readily than dry air, and is better for health, as well as more comfortable.

4. It is advisable to keep a jar of water near one of the first-floor registers that sends out the most heat. Change the water frequently, preferably every day.

5. Hot-air pipes should have a good pitch upward from the furnace, and should be of sufficient diameter. They

should also be wrapped with sheet asbestos. A separate pipe for each room with a turn damper near the furnace is a good rule. Each pipe should be labeled, so that certain rooms can be shut off at the furnace when desired.

6. Be sure the fire-box is gas-tight. All cracks must be thoroughly cemented or a new section put in before winter sets in. Otherwise coal-gas will escape into the air-jacket and be carried up directly to the rooms.

7. Study carefully the General Rules pertaining to other types of heating-plants as well as your own. Notice the "clean-out" door and remember why it is there.

Steam Heaters—Specific Rules.

1. The water in the boiler should be completely changed at least as often as every spring and every autumn. Draw a bucketful of dirty water from the bottom at least twice a week and each time replenish with fresh water from the supply-pipe. Cleanliness of water in the boiler is prime importance.

2. Look at the glass water-gauge whenever you attend to the fire. Turn the exhaust-cocks above and below the gauge occasionally to make sure that it is not clogged or the openings to it from the boiler closed up. They must be kept open.

3. The level of the top of the water must always show at some point along the gauge. Its height will vary with the temperature of the water; but if it rises about the top of the glass there is too much water in the boiler and some must be drawn off; and if it sinks below the bottom of the glass some more water must be let into the boiler.

4. Be sure that the exhaust-valve of each radiator works. Sometimes these valves need cleaning with a pin or soaking in kerosene. If in doubt about one of them unscrew it from the radiator when the fire is low and there is no steam-pressure, or else after turning off the radiator. If you can blow through it, it is all right. If not it must be cleaned until you can. Don't fail to replace it. It is advisable to have an extra valve to replace any one that is temporarily out of order.

5. Don't fail to study the General Rules, applicable to all heating-plants, and also to keep the boiler-flues clean.

Hot-Water Plants—Specific Rules

1. All the water should be emptied from the plant and clean water put in at least as often as every spring and every autumn.

2. When the first fire of the season is built, as the water gets heated, take the raidiator key and open up the exhaust-valve of each radiator in turn until all the air remaining in each radiator is allowed to escape. Repeat this operation occasionally to make sure there is no air interfering with free circulation of the water.

3. Always be sure that water shows in the glass gauge of the exhaust tank, which is usually located in the top story of the house above the level of the radiators.

4. Be sure the boiler is covered with asbestos, as well as the pipes in the cellar.

5. Study carefully the General Rules relating to all types of plants. Keep heating surfaces of the boiler well cleaned.

The Kitchen Range.

1. Avoid too much shaking. Live coals in the ash-pit mean wasted fuel. Clean ash-pit daily to prevent damage to grates.

2. Clean the entire stove well inside, on top of the oven and below the oven, frequently and thoroughly.

3. Stoke frequently and in small amounts.

4. Never shake a low fire until a little fresh coal has been added and given time to ignite.

5. Keep a pan or kettle of water always on the kitchen stove. Moist air makes for comfort, health, beauty and economy.

6. Read the General Rules applying to all household coal-burners.

Advantages of Moist Air in Rooms.

As humidity of the atmosphere controls the distribution of the sun's warmth upon the earth, so does moisture in the air of the home have a controlling influence upon its comfort. If the air in a room is dry, the heat from stove, register or radiator, strikes through this dry air readily, and, without being absorbed, rises quickly to the ceiling; while if the air is moist the heat is absorbed and the general temperature of the atmosphere of the room is perceptibly raised.

Clouds have a cooling effect on a hot day because they are masses of moisture, absorbing heat from the sun's rays before it reaches the earth.

While a damp climate is enervating in hot weather and biting in cold weather, nevertheless, a moderately moist atmosphere in the temperate warmth of the living rooms adds to comfort and works for economy and health. The air of heated rooms is nearly always too dry.

In dry air the evaporation from skin, throat and lungs is increased; illustration of this is the fact that woodwork and furniture usually swell when exposed to the natural summer atmosphere, while they shrink and crack in heated rooms in winter.

It is advisable to keep a bowl or open jar or two of fresh water in each heated room, giving the air a chance to absorb moisture from them rather than from your body and the furniture.

Electric Railway and Power Rates Increased by General Statute

The following are extracts from the text of the Statutory Undertakings (Temporary Increase of Charges) Bill which, as amended, was read the third time and passed by the British House of Commons on July 24 and by the House of Lords on August 2. It received the Royal Assent on August 8. The Bill enables the statutory provisions affecting the charges which may be made in respect of certain undertakings, including tramways, to be modified during the continuance of the present war, and for two years thereafter.

1. (i). Where it appears to the appropriate Government department that the financial position of any undertaking to which this Act applies has been adversely affected by circumstances arising out of the present war, the Department may, if they think fit, by order provide for the modification of any statutory provisions regulating the charges to be made by the undertakers, and of any statutory provisions consequential on or supplemental to any such provisions as aforesaid, for such period during the continuance of this Act, in such manner, and subject to such conditions, as appear to the Department to be just and reasonable:

(a) Where the undertakers are a local authority no modification shall be authorized which will increase the statutory maximum charge by more than 50 per cent., or which is more than sufficient so far as can be estimated to enable the undertaking to be carried on without loss; and

(b) In any other case no modification shall be authorized which is more than sufficient to enable with due care and management a dividend on the ordinary stock or shares of the undertaking to be paid at three-quarters the standard or maximum rate of dividend, if any, prescribed for the undertaking, or at three-quarters the pre-war rate of dividend, whichever is lower.

(ii.) An application to a department for the purposes of this Act shall be accompanied by such information, certified in such manner as the department may require with respect

of the financial position of the undertaking in question, and before making an order the appropriate Government department shall require the undertakers to give public notice of the application for an order under this Act and as to the manner in which and time within which representations may be made, and to give a similar notice in writing to the council of each county, borough, or urban, or rural district within which any part of the undertaking or limits of supply of the undertaking is situate, and the department shall consider any representations which may be duly made.

(10.) The undertakings to which this Act applies are tramway undertakings, including light railways constructed wholly or mainly on public roads, and undertakings for the supply of gas, water, hydraulic power and electricity.

The act is applicable also to Scotland and Ireland.

Montreal Tramways Fares

As the result of the appeals to the Quebec Public Utilities Commission, the latter have issued a new schedule of fares to be charged by the Montreal Tramways Co. which is a compromise between the fares favored by the Tramways Commission and those asked by the Company. The Public Utilities Commission have directed a cash fare of 6c or 25c for five tickets during the hours from 5 a.m. to midnight; working men's tickets from 6 to 8 a.m. and 5 to 7 p.m. will be secured at the rate of 6 for 25c, and school children 7 for 25c. From midnight till five o'clock in the morning the cash fare is 15c. The Tramways Commission reported in favor of a 5c fare with a cent transfer, and the Tramways Company desired a 7c fare with free transfers. The Public Utilities Commission in their judgment deal at length with the arguments of the Company and those who objected to an increase in fares, and state that the increases allowed is a matter of maintaining the undertaking as an efficient and going concern. Urban transportation was essential, and it could not be long maintained at less than cost. The report says:

"This has had to be recognized the world over, and is a consequence of the abnormal conditions through which we are passing. In all spheres of activity, transportation among the rest, prices and rates have been increased, and we have not gone farther in this direction than necessity and the terms of the contract appear to demand."

Personals

Mr. J. N. Mochon has been appointed assistant superintendent of the lighting department of the City of Montreal.

Captain Paul F. Sise, vice-president of the Northern Electric Co., Montreal, has been given a command in the Canadian Siberian Expedition.

Mr. E. J. Stapleton, secretary of the Water & Light Commission at Collingwood, has been confined to his house with inflammatory rheumatism. Mr. Stapleton is now reported to be well on the road to complete recovery.

Mr. W. G. Gordon has severed his connection with the Railway and Power Engineering Corporation and returned to the Canadian General Electric Company where he now holds the position of Transportation Engineer.

Mr. C. J. DeBats, who for the past four years has been manager of the Walkerville Hydro-Electric System and recently manager of the Essex County System, has resigned his position with the Commission to accept a position in his home, Bay City, Michigan. Mr. DeBats has been appointed manager of the Bay City Light & Power System.

Mr. A. Winfield, district superintendent for the Maritime Telegraph and Telephone Company in Cape Breton, has been appointed superintendent of all the company's plants with headquarters at Halifax. He will be succeeded by Mr. J. A. MacKinnon, district superintendent for Pictou County. Mr. Winfield was at one time general manager of the Prince Edward Island Telephone Company, Charlottetown.

Mr. R. J. Needham has been appointed mechanical and electrical engineer, motive power and car departments, Grand Trunk Railway, with headquarters in Montreal. Mr. Needham is a graduate of McGill University in electrical engineering. He was formerly on the staff of the Detroit Edison Company, at the Delray power plant. Since 1911 he has been on the electrical engineering staff of the Grand Trunk Railway system.

The Senneville Development Co., Ltd., has been incorporated with a capital of $20,000 to generate and transmit electricity for the company's business and to sell the surplus in the parish of St. Anne, Jacques Cartier County, P.Q. The head office is in Montreal.

Plan to Hear Mr. Goodwin on October 15

"The Goodwin plan has been printed and re-printed time and again, but some way or other there is considerable misapprehension on the part of many electrical men as to just what the actual interpretation of his plan may be. Perhaps the whole situation is best explained by saying that Mr. Goodwin simply advocates the exercise of common sense in the solution of the electrical problem. Indeed, after reading his platform one cannot resist the temptation to say, 'Why, of course, that is the natural thing and just what I have always advocated.' Mr. Goodwin does not raise any contentious points, does not ask any one element in the industry to sacrifice anything to any other element. His plan means a common benefit to all interests concerned. In studying Mr. Goodwin's platform, therefore, do not look for anything difficult to understand. Do not try to read anything in between the lines. His scheme is as simple as it looks, and it looks as if it would work out very simply."

Mr. Goodwin speaks at the King Edward Banquet, Tuesday Evening, Oct. 15, 6.30. We believe his message is of sufficient interest to command the attendance of every manufacturer, retailer, central station man, dealer and contractor. Those who have heard Mr. Goodwin explain his plan claim that it is simple, effective and comprehensive.

The Dealer and Contractor

News from the Front Lines—Mr. Earle's Ambition to Get Home and Settle Down as a Quiet Citizen

Another typical letter has just come to hand from Mr. Rufus Earle who, at latest report, is still vigorously carrying on in France. The following extracts are of special interest:—

In the Field, August 12th, 1918.

"I see by the Canadian Daily Record, the paper published daily by the Record Office for circulation among Canadian troops in the field, that you have been having strenuous times in Toronto of late, and that Tommy threatens to read the Riot Act if the disturbances are not stopped. I am not greatly in sympathy with the aims and conduct of the Great War Veteran's Association, and kindred bodies, and think that they have been formed principally as mutual admiration societies to keep the claims of the soldier ever in the public eye. My greatest ambition just now is to get home and settle down as a decent quiet citizen, and forget that I ever was in khaki. They seem to be so proud of the fact that they donned the uniform that they insist on advertising the fact, and perpetuating the memory. Virtue will be its own reward, and I think that few of us are looking for any particular rewards, except some of the ranters, and I feel that if the truth were known the men who are talking the loudest and making the greatest display of their so-called patriotism were the men who saw the least of the fighting. While the war has changed us all a great deal, not only physically but mentally, I really think that the average boy who enlisted will go back much the same as when he left, except that his horizon in his views of life will be greatly widened, and his experience out here, where human life is held so cheaply will tend to make him more generous in his ideas, and less self-centred.

"If you will remember when you receive this letter what was happening in the war zone at the time I wrote it you will know that we are in the midst of strenuous happenings these days, and events that forbode good times for us for the future. I was down to a prisoners cage near here the other day, and a large party of the captured Huns were being marched in by a party of husky Americans. One of the U.S. Sergeants and myself had quite a talk, and he was telling me a rather funny incident. There was a German Major in the party, who spoke rather good English, and he inquired from this sergeant where he came from. The Sergeant replied that he came from Chicago, whereupon the Major went into details regarding relatives that he had living in Chicago. The Sergeant "Do you know where these people are now?" to which the Major replied "No." "Well, they are over here looking for you" was the Sergeant's reply. A pretty good answer I thought. Of course we don't know yet the full story of these operations of the past few days, but by the time this letter reaches you they will have been history, and it looks as if it will prove one of the most brilliant, if not the most brilliant success of this war. Just at present all kinds of rumors are rife. Naturally as advances are made it is necessary to establish good lines of communication, and as a sequence, we are very busy just now.

"I had just gone to bed the night before last when I heard Bosche bombing planes overhead, and went out just in time to see one Gotha neatly focussed in the rays of about four of our powerful searchlights, and just about 100 ft. above the Bosche machine could be seen the signal light of one of our planes. Just as I got to the door our man opened up on the Heinie with his Lewis Gun, and you could follow the string of red hot bullets from his gun to the enemy plane quite distinctly in the dark. All of a sudden Mr. Hun bursts into flames, and makes a perfect nose dive from the ground. It was over in a matter of seconds. This is the first plane I have ever seen brought down at night.

"I am most anxious to get down and visit my old Battalion as soon as I possibly can, and see how the boys fared in the recent strenuous fighting. Of course, we all know that the Canadians have so far given a magnificent account of themselves, and have added to their glory in this battle. However, I am naturally anxious about some of my good friends in the Battalion, and would like to know how things went with them. Just at present, however, our motor transport is so busy that it is doubtful if I can get a car to run down for a few days yet. However, by that time things will have quietened down, and I may be able to spend a day with them if they are out of the line then. Yesterday mail came in from Canada postmarked Toronto July 24th, making 18 days for the journey, which is rather remarkable. I did not get any letters, but am looking forward to getting some in to-night's mail when the balance of this Canadian mail will reach us.

"The chap with whom I was on leave last year (I think I sent you a snap taken at Versailles of the two of us) has left the 116th Orderly Room, and when last I heard from him he was down at the Canadian Corps School taking a general infantry course, which was to be completed on August 5th. This would bring him back in time for the rush, and as he had left the Orderly Room, I am afraid that probably he went in as a platoon sergeant, and I am greatly worried about him. I sometimes feel that I am so far away from the actual big things in this war since I transferred that I am not doing any useful work, and have a longing to get back to the heart of things, so do not be surprised if you hear shortly that I have again changed over. Of course, if I do go back, this time I want something better than I had when I was there previously, and I am for that reason for one, anxious to get down to see the Canadians, to see how the land lies."

The Square D. Company, safety switch manufacturers, announce the appointment of Mr. R. J. A. McCleary to succeed Mr. John Plate as manager of their office and factory at Walkerville, Ontario. Mr. McCleary was formerly purchasing agent for the Square D Company, Detroit, and has been with them for about three years. Mr. Plate has resigned to enter the United States army and will be stationed for the present at Fort Dodge, Iowa.

The Ontario Association of Electrical Contractors and Dealers

A special meeting of the Toronto Electrical Contractors' Association was held in the King Edward Hotel on Thursday, September 26, regarding the organization of "The Ontario Association of Electrical Contractors and Dealers." The notice of this meeting reads as follows:

To All Members of The Toronto Electrical Contractors Association.

Hereby take notice of a Special Meeting at which the following Resolution is to be presented for adoption:

WHEREAS, in the opinion of the Executive Committee it is considered desirable to organize an association to be known as "The Ontario Association of Electrical Contractors and Dealers," in affiliation with the National Association of Electrical Contractors and Dealers forming a part of the Canadian division of the said National Association of Electrical Contractors and Dealers:

AND WHEREAS application has been made for a charter to incorporate the said proposed "The Ontario Association of Electrical Contractors and Dealers" under the Ontario Companies Act:

THEREFORE be it resolved that this Association approves of the said proposed incorporation.

AND be it further resolved, that upon the incorporation and organization of the said proposed "The Ontario Association of Electrical Contractors and Dealers" this "The Toronto Electrical Contractors Association" shall be deemed to be merged in the said proposed "The Ontario Association of Electrical Contractors and Dealers."

AND be it further resolved that all members of this "The Toronto Electrical Contractors Association" shall be deemed ipso facto members of the said "The Ontario Association of Electrical Contractors and Dealers."

AND be it further resolved that all the moneys and assets of this "The Toronto Electrical Contractors Association" be turned over and conveyed to the said "The Ontario Association of Electrical Contractors and Dealers" and that this resolution shall be authority to the Treasurer and other officers of this "The Toronto Electrical Contractors Association" in that behalf.

E. F. W. Salisbury,
Secretary.

Smoke Prevention—Coal Saving Suggestions

Just at this time when the conservation of coal is an absolute necessity and every practical suggestion for such conservation is a shot at our enemy, everyone realizes that smoke issuing from boiler stacks represents unused heat units, but everyone does not realize that certain simple rules, if observed in the fire room, will materially decrease this loss. The suggestions herein are based on many years' experience of the Westinghouse Electric & Mfg. Company's combustion engineers and are briefly outlined below.

1. Give your fireman an opportunity to acquire the fundamental principles of fuel burning.

2. If you have a difficult fuel problem, consult a combustion engineer.

3. Prevent smoke by proper firing methods.

4. Use gauges to indicate exactly the condition of fire bed at all times. As a minimum these gauges should consist of draft gauge indicating draft in furnace above fuel bed, draft gauge indicating draft at boiler side of flue damper and a steam flow meter for individual boilers.

5. CO_2 is the principle product of complete combustion of coal. Ten to twelve per cent. CO^2 should be obtained in flue gases to insure minimum fuel loss.

6. Avoid loss due to unburned coal in the ash.

7. If you are wasting exhaust steam, you are wasting coal.

8. Do not permit grates to clog. A systematic method of keeping the air spaces clean must be followed.

9. Inspect the baffles in boilers as broken or leaky baffles raise the flue gas temperature and waste coal.

10. Avoid leaking in of cold air around boiler setting.

11. Install stokers. Hand firing is rapidly being recognized as an obsolete and wasteful method of firing.

12. Clean scale from tubes as every particle of scale represents wasted coal.

13. Avoid soot formation. All boiler tubes should be blown externally once every eight hours when in continuous service.

14. All smoke flues should be as short and straight as possible. Flues should also be made air tight and all joints and connections should be well fitted, caulked and riveted. Use asbestos gaskets on clean-out doors.

15. Locate flue dampers in front of boiler so that fireman will adjust them as required. Dampers located in rear of boilers are seldom disturbed regardless of conditions.

16. The size of coal has much to do with capacity and efficiency of boilers. In general, the air pressure penetrates the fuel bed formed by coarse coal easier than that formed by finer coal, resulting in disturbance of best furnace conditions.

Mr. W. L. Goodwin, who will be the chief speaker at the Electrical Men's Banquet on Tuesday, Evening, October 15, 6.30 p.m.

In addition to the above suggestions, the following "don't fail to do" list should be followed.

Don't fail to:—

Keep the heating surface of the boilers free from soot, scale or oil.

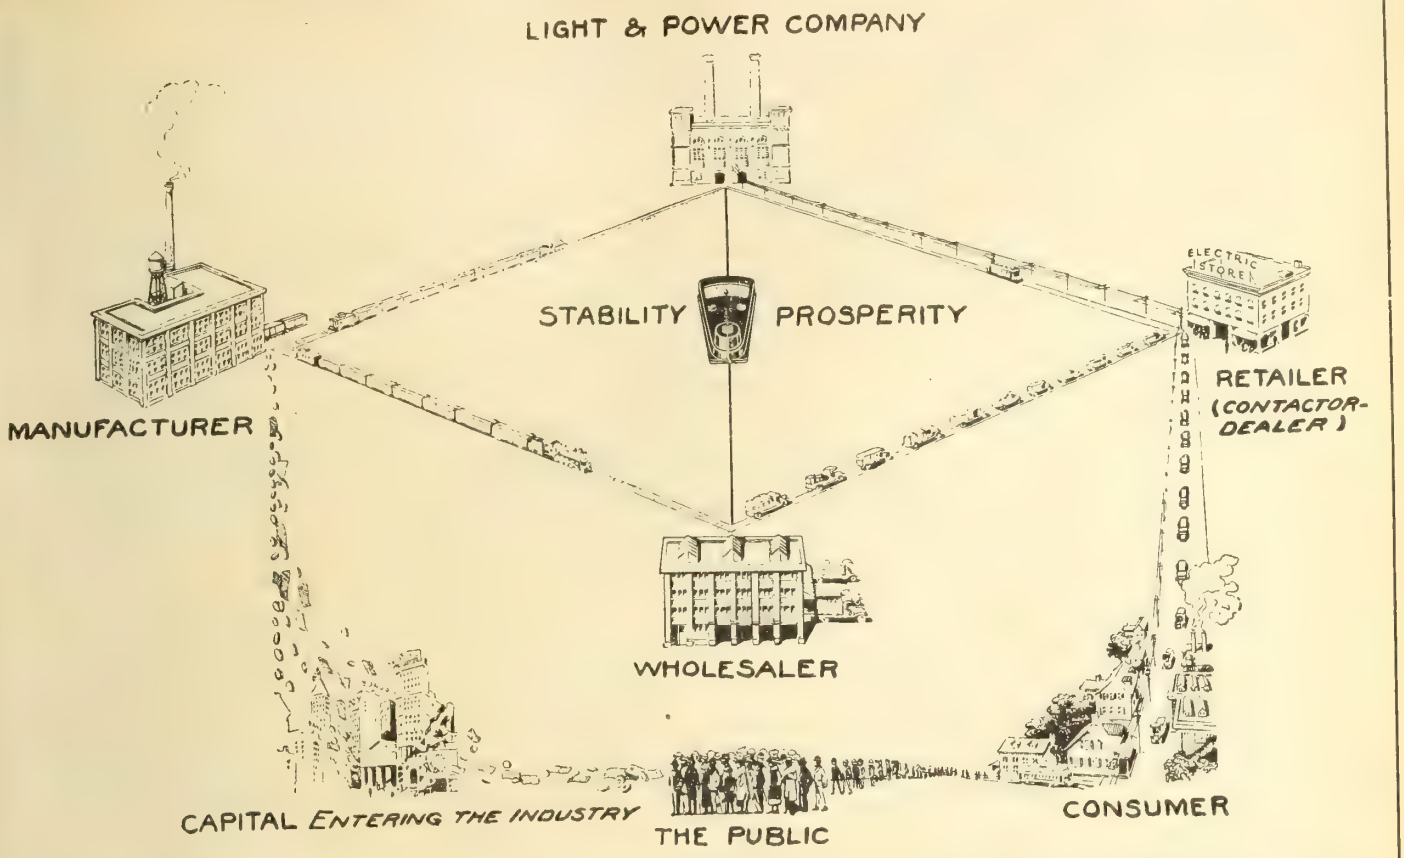
Keep the fires level and free from holes.

Do not carry the fires so thin as to draw a lot of excess air through.

Do not carry the fires so thick as to have incomplete combustion of the coal.

Do not soak the coal with water before firing.

Be sure the blow-off valves do not leak.

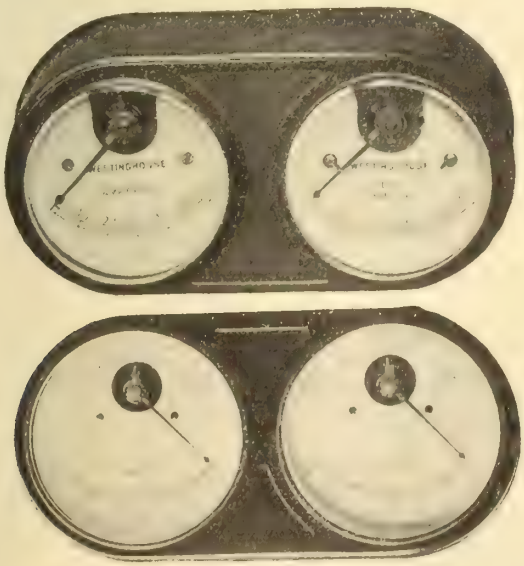


Do not have the safety valve popping off continually.

Cover steam pipes.

Do not waste steam through leaky valves or traps.

Never use live steam if exhaust steam is available and can be used as well.



An observance of the foregoing simple rules and suggestions should materially reduce the coal consumption of the average plant.

In this unique drawing, Mr. W. L. Goodwin illustrates the analogy between the different parts of a Wheatstone Bridge and the various elements in the electrical industry. There must be a proper "balance" between the manufacturer, wholesaler, central station and retailer. The public is the "battery" which furnishes life to the whole combination. If any one part of the instrument fails to perform its proper function results are unsatisfactory all round.

New Duplex Instruments

In its new catalogue on Instruments and Relays, just published, the Westinghouse Company announces two new duplex instruments for battery charging, marine, dental, telegraph, telephone, farm lighting, and other compact instrument panels where direct-current is involved. These duplex

instruments consist of any two standard type AW or type FW instruments desired, mounted in an attractive dull-black metal case. The type AW instruments have round open faces, three inches diameter, with glass cover and rear mounting studs; the type FW have five-inch faces.

A Protection Against Reversed Phases

If a three-phase motor is disconnected from a circuit and the phases reversed when it is reconnected, it will, naturally, run backward. Such a reversal may occur and has occurred when the motor is disconnected for repairs, through an error in reconnecting leads at the power house, or sub-station, or from a number of other causes. In many cases the reversal of rotation of a motor, aside from the inconvenience it causes, is not a serious matter as the error can be corrected at the

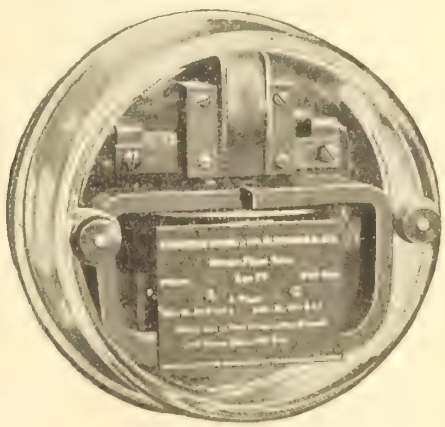


Illustration of relay.

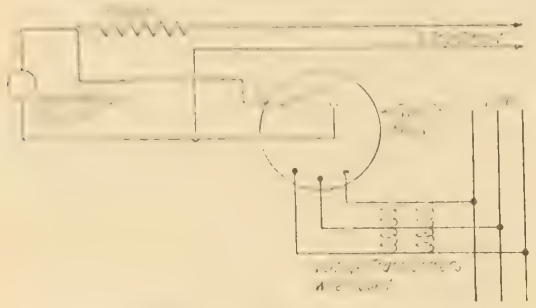
motor terminals. In other cases, however, serious consequences may result. The reversal of an elevator motor, for instance, might result in wrecking the machinery and loss of life. To protect motors against phase reverse where such protection is necessary, the Westinghouse Electric & Mfg. Co., have developed a reverse-phase relay with very positive

and dependable operating characteristics. If a phase is reversed, or if a phase fails, or if the voltage drops below 75 per cent. of normal, the relay contacts close and trip the circuit-breaker, either through a shunt-trip coil or by short-circuiting an under-voltage trip coil having a series reverse current. The relay operates on the induction principle. When properly connected the torque holds the contacts open



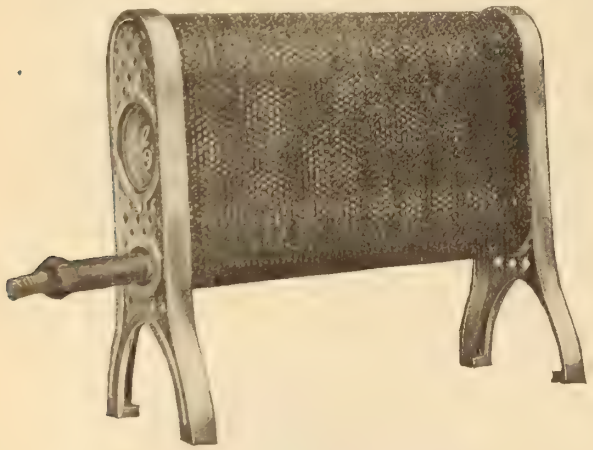


Diagram of relay connections.

against the restraint of a spiral spring. On low voltage the torque diminishes and the spring closes the contacts. On reversal of phase connections the reversed torque assists the spring in closing the contacts. The contacts will close 5 amperes at 250 volts or less.

660 and 1000 Watt Heaters

In view of the fuel situation there will probably be a general demand for electric air heaters this fall, and the Canadian General Electric Company offer the heater shown in the illustration. These heaters are built with a capacity of either 660 watts or 1000 watts, either nickel plated or with

Japan case. While they are intended principally for the early fall or the late spring days they will go a long way towards helping out the heating system on extremely cold days. They are built for service; are strong, durable and neatly designed.

The Bell Telephone Co. have filed with the Board of Railway Commissioners a new schedule of night rates for long distance calls. Between the hours of 6 a.m. and 8.30 p.m. the present day rates will apply, from 8.30 to 11.30 the rate will be 60 per cent. of the day rate, and from 11.30 p.m. to 6 a.m. 40 per cent. of the day rate.

Both the gross earnings and surplus of the Montreal Light, Heat & Power Co. continue to increase. For Aug. the gain in gross was $61,045 and in the surplus of $19,208. For the four months of the financial year the gross earnings increased $328,207, and the surplus $87,177.

Annual Convention of Illuminating Engineers

The Illuminating Engineering Society will hold its annual convention at the Engineering Societies Building, New York on Oct. 10, 1918. War-time lighting economies, the use of better lighting in speeding up war production and manufactures, the lighting of camps, effect of lighting curtailment on crime, and automobile headlight laws will be discussed.

Quebec Railway, Light and Power Co.

For the year ended June 30 last, the gross income of the Quebec Railway, Light & Power Co., was $2,027,940, a decrease of $34,943. Operating and maintenance charges totalled $1,235,724, an increase of $79,755, but fixed charges and taxes were less by $9,418. After writing off $26,789, the net surplus is $68,518, a decline of $43,152. The total surplus now stands at $753,090. The company expended $243,225 on maintenance account, which was charged to operation, in order to maintain in a high state of efficiency the physical condition of the properties and plant of the company and its various subsidiary companies.

Hydro Power for Unionville

The ratepayers of Unionville, Ont., recently passed a by-law authorizing the expenditure of $10,000 for the purpose of bringing in Hydro power. Work will be commenced in the near future. Following the installation of Hydro power in this place it is expected that the village of Markham will receive power by the same route instead of via Malvern, as was contemplated.

B.C. Association votes to join National

The British Columbia Association of Electrical Contractors and Dealers, at their last meeting, unanimously voted to associate themselves with the National Association of Electrical Contractors of the United States.

Eugene F. Phillips Electrical Works, Ltd., Montreal, have received an order from the Ontario Hydro Electric Commission for 9,000 feet of 350,000 c.m. 3 conductor 12,000 v. paper insulated lead covered double steel tape armoured cable.

W. J. Egan, Canadian Trade Commissioner, Cape Town, South Africa, states that there is an urgent need for electrical supplies in that country—particularly material for telephone and telegraph systems.

Condulets—The Crouse-Hinds Company of Canada are distributing a little folder, "Safety First Switch Condulets," describing the MK series, 30 to 200 amperes, fused, iron-clad and fool-proof.

In the United States there are three cities in which the electric railway fare is 10 cents ; one city pays 8 cents; 43 pay 7 cents and 85 pay 6 cents.

The Canadian Westinghouse Company have opened a repair department and service branch at 16 Temperance Street, Toronto.

McDonald & Willson, Limited, electric dealers, have moved from 12 Queen Street East, Toronto, to 349 Yonge Street.

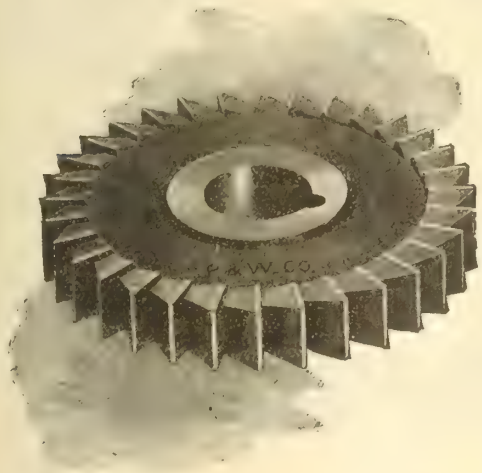
Porcelain Enameled Reflectors

For Every Class of Industrial Illumination

ABOLITES

Shade Holder, Bowl Type Abolite

Holder Socket, Dome Type Abolite



Holder Socket, Diagonal Type Abolite

INDUSTRIAL ABOLITES have gained wide adoption throughout the offices, factories, and plants of the Dominion. By their uniformity and correctness of design and construction, they are dependable as a means to lighting efficiency. The holder sockets are thoroughly ventilated with best heat radiation. Readily installed, the cost of maintaining them bright and efficient is a minimum.

In bowl, dome, diagonal, enameled holder-socket, boulevard and street front types. This excellent line of Reflectors is complete, furnishing a design for every lighting requirement. It is a safe line to buy and a quick one to sell.

Current News and Notes

Brantford, Ont.

The Brantford, Ont., hydro-electric commission have decided upon the installation of nitrogen lamps for the down-town street lighting, replacing the carbon lamps which for maintenance and renewal have been found too expensive. The city of Winnipeg has offered to purchase the old lights.

Campbellford, Ont.

The Hydro-electric Power Commission of Ontario are preparing plans for the construction of a hydro-electric plant at Rainey's Falls on the Trent River. At this point there is a possible capacity of eight to ten thousand horsepower.

Galt, Ont.

Alterations are being made to the Galt hydro-electric substation in order that current may be received at 13,200 volts instead of 6,600, as formerly.

Gilbert Plains, Man.

A meeting of the ratepayers of Gilbert Plains, Man., was held recently to discuss the possibility of installing a municipally owned electric lighting plant. Particulars and estimates are being asked for.

Hamilton, Ont.

It is stated that the Hamilton, Ont., public have taken very kindly to the p.a.y.e. system which will shortly be installed on all cars. The railway company hopes for an increase in revenue and a decrease in accidents.

Kingston, Ont.

Employees of the Kingston, Portsmouth & Cataraqui Railway Company, Kingston, Ont., have been voluntarily granted a wage increase of 25 cents a day. Eleven conductorettes are included.

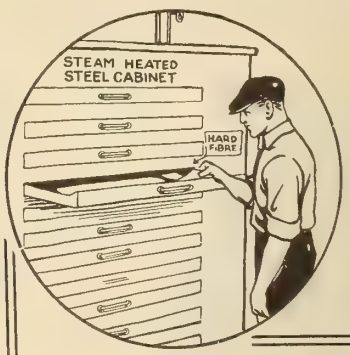
St. John, N.B.

The city council of St. John, N.B., have resolved to investigate the possibilities of the Mispec Stream with a view to power development.

Smiths Falls, Ont.

Hydro energy from Merrickville was recently turned on in the Smiths Falls system. The two local plants are being overhauled and will take care of the load in supplying several big industries.

Toronto, Ont.



The Toronto and Niagara Power Company has made application for the right to construct another cable line from their power house on Davenport Road, along the C. P. R. right-of-way to a point where it will be convenient to branch off into York township and to the town of Leaside. The reason given is that the munition company at Leaside is in urgent need of power.

Winnipeg, Man.

The Peerless Sales and Construction Company, Winnipeg, Man., dealers in electrical goods, have been incorporated.

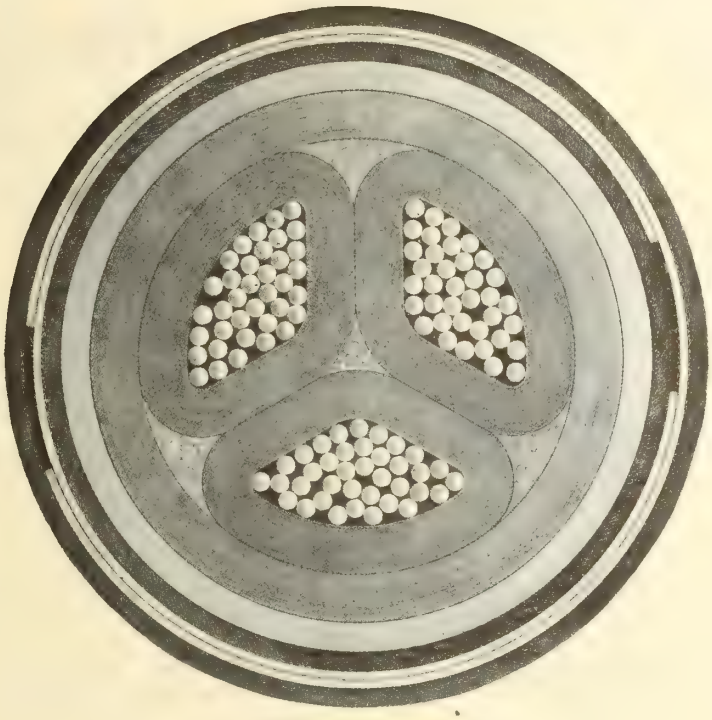
Give It the Heat Test

Spaulding HARD FIBRE

Put a sheet, rod or tube of Spaulding Hard Fibre in a dryer or hang a piece of it in a hot place. You'll be convinced that it will not dry out, become brittle, nor lose its toughness when used near heat.

A 100% material for many purposes



Its electro rupture is 200-400 volts per 1/1000 inch of thickness; tensile strength 10,000-20,000 lbs. per square inch; compressing point, 38,000-42,000 lbs. per square inch; shearing strength 9,000-13,000 lbs. per square inch. It can be machined, sawed, stamped, bent, threaded, drilled and finished in many attractive ways.

Made in red, black and grey colors. Send for samples. Our Specialty Department is equipped to machine special parts to your own specification.

LINCOLN MOTORS

Lincoln Arc Welders

SAVE 50%

You can save 50% — very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100% strong — rivetted joints are no stronger than the rivets themselves.

The Lincoln Arc Welder avoids awkward overlapping on corners, thus saving time.

Its heat is greater, more concentrated, and more readily controlled than that of any gas or other welding system, and the current is all usefully employed—there are no "ballast resistances" to waste 50% to 80% of the power taken.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

POSITIONS VACANT

Wanted: Experienced man, returned soldier preferred, to act as Meter Reader and Inspector. Apply, stating experience, to Smiths Falls Hydro-Electric System. 12 t.f.

WANTED

Technically educated man, one not subject to Military Draft, as Mechanical Superintendent of a large public service corporation operating both Gas and Electricity, must have thorough knowledge of the manufacture of Transformers, Gas Meters, Electric Switches, Fuses, and Electric Line material; be experienced in the maintenance of the above as well as Hydraulic Turbine, Steam Turbine and Reciprocating Engine Equipment of various kinds; must also have experience on the operating and maintenance of a fleet of Motor Vehicles, both Electric and Gasoline, and a knowledge of maintenance of Edison Batteries. Apply, giving experience and references, through this journal. Box 788 Electrical News, Toronto, Ont. 19

Chaufferless Utility Vehicles

By A. Jackson Marshall

Heretofore, anyone with sufficient money and a desire for a motor car with a chauffeur, and perhaps also a "footman," or lackey, could, and did, quickly gratify such wish. Most anything of a material nature could be had for money. Today, conditions are different—they will become more so as the war advances. Hundreds of thousands of men have been called to war. Millions—a much greater quantity than is generally realized in these days of huge figures—will follow. Ere long, men will seem as scarce as four leaf clovers. Men remaining will be engaged in serious and important war operations. Few men will be available for driving passenger cars, especially if their particular application consigns them to the "pleasure" class. The "two-men-on-the-box" exposition of wealth will be in the extinct class of the Dodo. The rapidly expanding use of the motor truck as an important link in the transportation chain, which daily becomes more vital to our success in war, makes increasing demands for chauffeurs. This ever-increasing demand, which must, and will be, met, will make further inroads on available chauffeur supply. The gasoline car chauffeur will be needed in great quantities for the driving of army trucks, tanks, aeroplanes, etc. This work is of cardinal importance, and the demand must, of necessity, be met. The ultimate result—already becoming evident—will be that gasoline passenger car owners—real and prospective—will drive their own cars, lay them up and do without them, or, if they ride, use electric vehicles, which they may readily operate with safety and comfort with little coaching.

But this chauffeur situation does not stop with driving—cars must be kept in running condition, and here again the "electric" is favored, for its design and construction is the personification of simplicity, there being but one moving part in the motor—the armature, and that revolves.

ESTABLISHED 1849
BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.
THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.
THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

You Pay For Good Wire

whether you use it or not. If you buy a cheap wire whose quality is kept down to meet a price instead of up to meet a standard, you may pay several times the cost of good wire in replacement of your wiring or the building in which it is installed.

"Sterling" Rubber Insulated Wire

is kept up to a high standard of dependability and is sold at a reasonable price that makes it available for the cheaper class of buildings. It has always exceeded the requirements of the N. E. C. by a liberal margin which constitutes the purchaser's insurance against the defective wire risk.

Moloney Service Transformers

are all supplied with brass plates fastened on the inside of the cover of each transformer; all connections marked plainly. They do not get covered with dirt or stained with oil like a blue print does. You always have them before you when changing taps. Heavy bushings eliminate breakages in shipment and handling

Moloney Transformers are manufactured in a factory that was built especially for that purpose only. They are designed by Engineers and built by men who make a specialty of this work.

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

GROWTH—

Day after day, week after week, month after month, for the five years that Economy Fuses have been on the market, the sales have maintained a constant growth—not alone in volume, but also in percentage of increase. This is because

ECONOMY Renewable FUSES

are absolutely accurate in operation and cut annual fuse maintenance costs 80%. An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

G&W ELECTRIC SPECIALTIES

A Few Means of Reducing Distribution Costs

—Equip to handle "trouble" without costly cable or line cutting.
—Eliminate expensive "temporary" repairs.
—Install cable-end sealing devices
—Stop extended service delays.
—Make every circuit interconnecting without cable or line cutting.

The experience of every seasoned Central Station Engineer will bear out the wisdom of avoiding the "penny wise pound foolish" policy in laying out any system for electrical distribution. On the other hand, it is often easy to swing too far in the other direction—to over-spend in obtaining flexibility in switching, protection from burnouts, etc.

It is the purpose of G & W distribution specialties to obtain maximum distribution economy—it is the purpose of G & W Engineers, with over 15 years' experience behind them, to aid in their most efficient application.

Use these devices and this engineering service to overcome and reduce your distribution difficulties. Lower your distribution costs!

Have you received new Catalog No. 10? Contains Valuable illustrations and drawings for every Central Station Engineer.
